² Museum Victoria, GPO Box 666, Melbourne, Victoria, 3001, Australia (gpoore@museum.vic.gov.au)

**Abstract**

Two species are newly described from the continental margin of Western Australia: *Oxypleurodon wilsoni* and *Rochinia annae*. *Oxypleurodon luzonicum*, *Rochinia carinata*, *R. pulchra*, *R. sibogae* and *R. strangeri* are newly reported from Western Australia. *Rochinia fultoni* and *R. mosaica* from south-eastern Australia are refigured.

**Keywords**

Decapoda, Brachyura, Epialtidae, new species, Indian Ocean, Australia

**Introduction**

The decapod crustacean fauna along the south-western and central continental margin of Western Australia has been recently revealed to be highly diverse and novel (Poore et al., 2008). These discoveries result from recent sampling, part of a project mounted by CSIRO Marine and Atmospheric Research (CMAR) and Museum Victoria entitled “Mapping benthic ecosystems on the deep continental shelf and slope in Australia’s South West Region”.

This contribution on majoid crabs is based on the collections made during the southern phase of this project (cruise SS10-2005) and on those taken during a second phase along the northern Western Australian continental margin (cruise SS05-2007).

Our classification of the Majoidea follows Ng et al. (2008). Poore et al. (2008) reported on 14 species of Epialtidae (3 probably new species), two species of Hymenosomatidae (one new), 20 species of Inachidae (two new) and 13 species of Majidae (three new). Of these 49 species, nine were reckoned to be new records of Indo-West Pacific species for Australia. This paper reports only on the epialtid genera *Oxypleurodon* Miers, 1886, and *Rochinia* Milne Edwards, 1875, other members of this family from these collections being relatively well known.

We remark on other species of *Rochinia* in the collections of Museum Victoria (NMV). Types are lodged in the Western Australian Museum (WAM) and Museum Victoria.

Measurements are given as greatest length (without pseudorostrum) and greatest width.

**Epialtidae** MacLeay, 1838

**Remarks.** Poore et al. (2008) listed 14 species in this family from the south-western Australian collections. Of these, *Austrrollinia gracilipes* (Miers, 1879), *Hyastenus convexus* Miers, 1884, *Naxioides robillardi* (Miers, 1882), *N. taurus* (Pocock, 1890), *N. tenuirostris* Haswell, 1880, *Phalangipus filiformis* Rathbun, 1916, and *P. hystrix* (Miers, 1884) were new records for southern or all Western Australia. They also reported *Griffinia lappacea* (Rathbun, 1918) and *Lahaina agassizii* (Rathbun, 1902) which were previously known. One specimen, which could not be identified at the time, belongs to a species of *Thacanophrys*.

**Oxypleurodon** Miers, 1886

**Remarks.** *Oxypleurodon* was redefined and separated from other similar genera by Tavares (1991) and several species from the Indo-West Pacific were reviewed by Richer de Forges (1995). Ng and Richer de Forges (2007) listed the 17 species known. Davie (2002) included the genus in the subfamily Pisinae of family Majidae. Following Ng et al. (2008) it is now in the family Epialtidae MacLeay, 1838, included inside the superfamily Majoidea. One species has been previously recorded from Australia, *O. stimpsoni* Miers, 1886, from Queensland (Davie, 2002). Here, a second species is newly
recorded for Australia and a third species is described as new from Western Australia.

**Oxypleurodon luzonicum** (Rathbun, 1916)

Figure 1a

**Oxypleurodon luzonicus.**—Richer de Forges, 1995: 48, fig. 1B, pl. 2A.

**Oxypleurodon luzonicum.**—Ng and Richer de Forges, 2007: 63.

Material examined. Australia. WA. Leveque L27 transect (15°00.52’S–1°45.05’S, 121°38.08’E –121°39°10’E), 205–211 m, 25 Jun 2007 (stn SS05/2007 099), NMV J58221 (2 females 11.7 x 9.7 mm, 11.8 x 10.1 mm; juvenile 5 x 3.9 mm).

Remarks. These specimens from the northern part of the Western Australian continental slope fit well with the description of *O. luzonicum* from the Philippines. These records extend the distribution of the species considerably south, to 15°S in the western Indian Ocean. The species’ distribution does not overlap with that of another *Oxypleurodon* from the southern part of the Western Australian slope which is described below as a new species.

**Oxypleurodon wilsoni** sp. nov.

Figure 1b

*Rochinia aff. luzonica.*—Poore et al., 2008: 56 (colour fig.).

Paratypes. Collected with holotype, WAM C400530 (ovigerous female, 16.4 x 14.0 mm). WA. Off Abrolhos (29°00.46’S–29°01.23’S, 113°46.44’E –113°47°06’E), 419–439 m, 03 Dec 2005 (stn SS10/2005 088), NMV J54070 (male, 18.5 x 19.6 mm). Off Two Rocks (31°37.05’S–31°37.23’S, 114°58.19’E –115°14.39’E), 364–404 m, 19 Nov 2005 (stn SS10/2005 004), NMV J54069 (3 males, 14.4 x 13.5 mm, 13.9 x 13.4 mm, 9.6 x 8.8 mm).

Diagnosis. Carapace to 18.5 mm, long, pyriform. Carapace, including pseudooral spines, covered with short setae. Carapace bearing several elevated plates and tubercles arranged as follows: 1 cardiac plate, round and forming a conical point in its middle; 2 branchial plates, thin, sharp and pointing laterally; 2 epibranchial plates, thin, sharp and oriented obliquely; 1 ovoid mesogastric plate; 2 hepatic plates touching the postocular plates forming together a L-shape; 1 small subbranchial oblong plate on the lateral border; 2 supraocular plates, sharp anteriorly; 1 antero gastric tubercle; 1 tubercle on each side of mesogastric plate; posterior border of the carapace thick, forming medially a large tooth pointing backward. Pseudooral spines long and sharp, diverging in a V. Eyes small, completely inserted in the orbits, the postocular plate forming a cup. Basal antennal article fused with carapace. Cheliped shorter than pereopod 2. Articles of ambulatory legs cylindrical. Female abdomen of 7 segments.

**Distribution.** South-western WA slope (29°–31.5°S), 329–439 m depth.

**Etymology.** Dedicated to Dr Robin Wilson in recognition of his enthusiasm and hard work during the cruise when this species was collected, and at all times.

In *O. wilsoni* the supraocular plates are sharp anteriorly whereas it is rounded in *O. luzonicum*. The cardiac plate is small, round and elevated in the middle (round and flat in *O. luzonicum*). The epibranchial plates are oblong, pointing externally in *O. wilsoni* but small and triangular in *O. luzonicum*. The mesogastric plate is oval but lozenge-shaped in *O. luzonicum*. Between the mesogastric spine and the hepatic spine lies a small tubercle absent in *O. luzonicum*.

*O. wilsoni* is distinguishable from *O. stuckiae* by the presence of a supraocular spine. The pseudooral spines are longer and less diverging in *O. wilsoni* than in *O. stuckiae*.

An anterior gastric tubercle in *O. wilsoni* is not seen in *O. stuckiae*.

*O. wilsoni* differs from *O. karubar* in the following characters: the epibranchial plate is straight but curved in *O. karubar*; the pseudooral spines are straight but enlarged basally in *O. karubar*; the anterior part of the supraocular plate is spiniform in *O. wilsoni* but rounded in *O. karubar*; the hepatic plate touches the postocular plate forming together an L-shape in *O. wilsoni* but these are several disjointed pieces in *O. karubar*.

The shape of the carapace is pyriform in *O. wilsoni* while it is large and rounded posteriorly in *O. lowry* i. The supraocular plate points forward in *O. wilsoni* but laterally in *O. lowryi*. The branchial spines are straight in *O. wilsoni* while they are curved in *O. lowryi*.

The ambulatory legs of the holotype and paratype from the same sample are mixed and it is not possible to be precise about the relative lengths of pereopods.

The species was collected over narrow latitudinal and depth ranges.

**Rochinia Milne-Edwards, 1875**

Remarks. *Rochinia* was redefined by Tavares (1991) updating the extensive revision by Griffin and Tranter (1986a) who provided a key to 29 species of a more inclusive genus. Davie (2002) included the genus in the subfamily Pisinae of family Majidae. Five species have been previously recorded from Australia (Davie, 2002). Ng and Richer de Forges (2007) listed the 24 species known from the Indo-West Pacific and ten from the north-western and western Atlantic and eastern Pacific Oceans. Here, we add three species described originally from the Indo-West Pacific to the Australian fauna, comment briefly on three
Figure 1. Lateral and dorsal views, scale = 5 mm. a, *Oxypleurodon luzonicum* (female, NMV J58221). b, *Oxypleurodon wilsoni* sp. nov. (holotype, WAM C400259). c, *Rochinia annae* sp. nov. (holotype, WAM C400531). d, *Rochinia carinata* (male, NMV J53872).
others, and describe a new species from Western Australia.

Rochinia annae sp. nov.

Figures 1c, 3

Rochinia sp. MoV5119.—Poore et al., 2008: 56.  
Rochinia fultonii.—Poore et al., 2008: 56 (colour fig.).

Paratypes. Same data as holotype, WAM C400532 (11 specimens), NMV J54179 (87 specimens, smallest is a male of 7.3 x 4.6 mm).

Other material. Australia, WA. Off Kalbarri (27°55.43’S–27°56.01’S, 113°08.17’E–113°08.38’E), 252–253 m, 04 Dec 2005 (stn SS10/2005 099), NMV J54058 (1 male). Off Two Rocks (31°36.32’S–31°37.02’S, 114°58.52’E–114°58.16’E), 329–370 m, 19 Nov 2005 (stn SS10/2005 006), NMV J54178 (2 ovigerous females 10.5 x 8.2 mm, 8.6 x 6.9 mm).  
Jurien Bay (29°52.04’S–29°52.26’S, 114°23.13’E–114°23.53’E), 414–401 m, 02 Dec 2005 (stn SS10/2005 078), NMV J54253 (7 juveniles). Off Lancelin (31°00.45’S–31°00.17’S, 114°49.30’E–114°49.23’E), 394–393 m, 01 Dec 2005 (stn SS10/2005 075), NMV J54238 (1 male). Off Bunbury (33°00.30’S–33°00.07’S, 114°34.16’E–114°34.30’E), 421–414 m, 20 Nov 2005 (stn SS10/2005 013), NMV J54073 (male 8.3 x 5.7 mm), J54238 (1 female 6.0 x 4.6 mm). Off D’Entrecasteaux (35°04.11’S–35°04.14’S, 115°20.10’E–115°20.53’E), 378–379 m, 21 Nov 2005 (stn SS10/2005 017), NMV J54961 (1 male 9.5 x 10.7 mm, 2 ovigerous females 8.4 x 6.1 mm, 10.5 x 7.4 mm, 2 females 7.6 x 4.7 mm, 7.2 x 5.2 mm).

Diagnosis. Carapace to 11.9 mm long, pyriform with long diverging pseudorostral spines (one-third length of carapace). Dorsal surface spiny, longest spines as follows: 2 longest and thin branchial spines twice as long as other spines; 1 intestinal spine; 1 long cardiac spine; 1 long mesogastric spine; 2 hepatic spines; in proto-gastric area, a line of 3 short blunt spines, 2 diverging pseudorostral spines (one-third length of carapace). Border of buccal frame expanded laterally. Anteriorly, the postocular tooth is distinct from the hepatic spine in R. annae whereas it is a fused plate in R. sibogae. The postocular tooth is distinct from the hepatic spine in R. annae whereas it is a fused plate in R. sibogae. The postocular tooth is distinct from the hepatic spine in R. annae whereas it is a fused plate in R. sibogae. The postocular tooth is distinct from the hepatic spine in R. annae whereas it is a fused plate in R. sibogae.  

Etymology. The species is named in honour of Anna McCallum, who sorted and made preliminary identifications of many of the Decapoda of the Western Australian cruises.

Remarks. Of the 35 species described in the genus Rochinia few have long branchial spines. The only species comparable to R. annae sp. nov. are: R. pulchra (Miers, 1886), R. riversandersoni (Alcock, 1895), R. sibogae Griffin and Tranter, 1986, R. galathea Griffin and Tranter, 1986, R. griffini Davie and Short, 1989, and R. paulayi Ng and Richer de Forges, 2007. R. galathea has a long branchial spine but a long and flat hepatic spine, very different from the spine of R. annae. R. sibogae has two very long branchial spines pointing laterally but two other long spines, one intestinal and one cardiac (one long gastric spine in R. annae). Also, the postocular tooth is distinct from the hepatic spine in R. annae whereas it is a fused plate in R. sibogae. R. pulchra has long branchial spines but a different pattern in the other long spines of the carapace: four spines in the median line (three in R. annae). R. pulchra possesses pseudorostral spines about three-quarters as long as the carapace but these are one third as long in R. annae. R. riversandersoni is a large species with long branchial spines and long epiphragmal spines. R. annae has only a granule at this place. R. paulayi and R. griffini are also large species, very spiny and showing a totally different arrangement of spines from that in R. annae.

Although there is abundant material no specimen is intact and it is not possible to be precise about the relative lengths of pereopods.

The species occurs over a wide geographic range along the south-western WA coast.

Rochinia carinata Griffin and Tranter, 1986

Figure 1d

Rochinia carinata Griffin and Tranter, 1986a: 178, figs 56, 64e, f, pl. 12.—Ng and Richer de Forges, 2007: 62.  
Rochinia sp. MoV 5136.—Poore et al., 2008: 56.

Remarks. Rochinia carinata was described from the Kei (Kai) Islands in Indonesia and has not been recorded anywhere else since. The specimens from the south-western Australian coast differ from the typical material from Indonesia (Griffin and Tranter, 1986a: pl. 12). The merus of pereopods 2 and 3 is cylindrical in cross section vs carinate in the Indonesian specimens. The mesogastric plate (islet) looks more ovoid in R. carinata from Western Australia whereas it is more rounded in the typical material. The pseudorostrum spines are more elongated in the specimens from south-western Australia than in the specimens from Indonesia.

The species’ range is extended from 5°S in Indonesia to 24°S, near Shark Bay, WA. The depth range in Indonesia is 204–325 m and 324–411 m in WA.
Rochinia fultoni (Grant, 1905)

*Hyastenus Fultoni* Grant, 1905: 313, pl. 11 fig. 1.  

**Material examined.** Australia. Tas. Eastern Bass Strait, 100 km NE of North Point, Flinders I. (38°52.36'S, 148°25.12'E), 140 m, 15 Nov 1981 (stn BSS 170 S), NMV J4731 (female 9.3 x 6.6 mm). Vic. Eastern Bass Strait, S of Waratah Bay (38°59.54'S, 146°00'E), 64 m, 26 Nov 1973 (stn K7-73-63), NMV J12157 (2 males 13.2 x 9.4 mm, 12.7 x 8.7 mm). Central Bass Strait, 100 km SSE of Cape Liptrap (39°45.54'S, 145°33.18'E), 74 m, 13 Nov 1981 (stn BSS 156), NMV J16042 (juvenile); NMV J4732 (female 8.1 x 5.1 mm). SA. Great Australian Bight (33°16.00'S–33°16.01'S, 130°36.35'E–130°38.02'E), 143–140 m, 10 May 2000 (stn SS01/00 350), NMV J52197 (3 males 9.1 x 5.8 mm, 9.4 x 5.9 mm, 7.7 x 4.3 mm; ovigerous female 9.1 x 5.7 mm; female 7.1 x 4.5 mm; juvenile 4.8 x 3.3 mm).

**Remarks.** This species has already been mentioned from the east and south coasts of Australia. Most records in Museum Victoria are from the continental margin of eastern Bass Strait.

Rochinia mosaica (Whitelegge, 1900)

*Pugettia mosaica* Whitelegge, 1900: 141, pl. 35 figs 5–7.  
*Doclea profunda* Rathbun, 1918: 16, pl. 7 figs 1a–c.

**Material examined.** Australia. Tas. Eastern Bass Strait, 100 km NE of North Point, Flinders I. (38°52.36'S, 148°25.12'E), 140 m, 15 Nov 1981 (stn BSS 170 S), NMV J4731 (female 9.3 x 6.6 mm). Vic. Eastern Bass Strait, S of Waratah Bay (38°59.54'S, 146°00'E), 64 m, 26 Nov 1973 (stn K7-73-63), NMV J12157 (2 males 13.2 x 9.4 mm, 12.7 x 8.7 mm). Central Bass Strait, 100 km SSE of Cape Liptrap (39°45.54'S, 145°33.18'E), 74 m, 13 Nov 1981 (stn BSS 156), NMV J16042 (juvenile); NMV J4732 (female 8.1 x 5.1 mm). SA. Great Australian Bight (33°16.00'S–33°16.01'S, 130°36.35'E–130°38.02'E), 143–140 m, 10 May 2000 (stn SS01/00 350), NMV J52197 (3 males 9.1 x 5.8 mm, 9.4 x 5.9 mm, 7.7 x 4.3 mm; ovigerous female 9.1 x 5.7 mm; female 7.1 x 4.5 mm; juvenile 4.8 x 3.3 mm).

**Remarks.** This material from south-eastern Australia fits well with the redescription of *R. mosaica* by Griffin and Tranter (1986a). Whitelegge described this species in the genus *Pugettia* in which the carapace has a similar pattern but the first pleopod of *Pugettia* is very different from that of *Rochinia*. The records are well within the reported distribution of the species from central Queensland, through Bass Strait to the Great Australian Bight. The most westerly is 130°W near the SA–WA border.

Rochinia pulchra (Miers, 1886)

*Anamathia pulchra* Miers, 1886: 26, pl. 4 figs 1a–c.  
*Scyramathia pulchra*.—Alcock, 1895: 202.—Dolefin, 1904: 84, pl. 27 fig. 12.  

121°25.53'E–121°27.01'E), 403–396 m, 03 Jul 2007 (stn SS05/2007 144), NMV J58220 (ovigerous female 28.7 x 21.9 mm). Lacepede L26 transect (15°47.34'S–15°48.30'E, 121°03.30'E–121°02.53'E), 119–111 m, 01 Jul 2007 (stn SS05/2007 129), NMV J55681 (male 12.9 x 10.2 mm).

Remarks. This species, characterised by its very long and numerous spines, has already been recorded from the north-west slope of Australia. The other records are from Japan to the Philippines. All these specimens are from extreme north WA. Griffin and Tranter (1986a) tentatively identified a female from NSW as this species but it was described as *Rochinia griffini* Davie and Short, 1989.

*Rochinia sibogae* Griffin and Tranter, 1986

Figure 2c

Material examined. WA. Mermaid L24 transect (16°38.04'S–16°38.46'S, 19°09.13'E–19°08.02'E), 990–987 m, 17 Jun 2007 (stn SS05/2007 068), NMV J58024 (ovigerous female 16.2 x 10.6 mm). Barrow L1 transect (20°57.09'S–20°57.34'S, 114°00.47'E–114°00.26'E), 1000 m, 09 Jun 2007 (stn SS05/2007 002), NMV J58142 (male 18.4 x 12.6 mm).

Remarks. This species was described by Griffin and Tranter (1986b) from specimens from Ceram Island, Indonesia. They gave a short key to species of this group of *Rochinia* where *R. sibogae* is clearly separated from the others by the hepatic plate fused with the postocular plate. This new locality for *R. sibogae* extends the range of the species far south of Indonesia, from 3°S to 20°S on the north-west slope at 1000 m, a similar depth to the type locality.

*Rochinia strangeri* Serène and Lohavanijaya, 1973

Figure 2d

Material examined. Australia. WA. Abrolhos (29°03.39'S, 29°04.41'S, 113°38.10'E–113°37.48'E), 1000–1037 m, 02 Dec 2005 (stn SS10/2005 084), NMV J55427 (ovigerous female 11.0 x 6.8 mm).

Remarks. This species was described by Serène and Lohavanijaya (1973) from only two specimens from the South China Sea. The closest species is *R. riversandersoni* (Alcock, 1895) from India. Serène and Vadon (1981), in a preliminary list of Brachyura from the MUSORSTOM collection in the Philippines, mentioned a specimen as *Rochinia aff. strangeri*. The photograph of this specimen looks very similar to the specimen from south-western Australia (29°S).

Acknowledgments

We thank Anna McCallum and Joanne Taylor, Museum Victoria, for sorting and cataloguing this collection. Thanks also to David Staples, Museum Victoria, for taking the photographs. The collections on which this project was based were made during expeditions organised by CSIRO Marine and Atmospheric Research (CMAR). We thank co-Principal Investigators, Alan Williams and Rudy Kloser, CMAR, for the organisation and management of the voyages, and to Karen Gowlett-Holmes and Mark Lewis for help on board RV *Southern Surveyor*. For financial support we acknowledge the Commonwealth Department of the Environment and the CSIRO Wealth from Oceans Flagship that provided funds for the field and laboratory components of the “Voyages of Discovery” program. This paper is a contribution to the Census of Marine Life project COMARGE (Continental Margins Ecosystems).
