## Abstract:

Inorganic arsenic is a ubiquitous metalloid, with well-known toxic properties for human health. In many regions of the world, human arsenic exposure is identified as a public health problem because of its presence in drinking water and certain food. Even at relatively low levels, regular consumption of contaminated water is considered to increase the risk of cancers in different organs, such as urinary bladder, skin, and lung, probably also liver, kidney and prostate. More recently, multiple other chronic diseases have been associated with environmental arsenic exposure, such as diabetes, cardiovascular diseases, as well as impaired immune function and child development. The WHO guideline water arsenic concentration is  $10 \mu\text{g L}^{-1}$ . Certain plants, rice in particular, is known to easily take up arsenic from the soil.

In the south regions of Bolivia, concentrations above  $100 \mu\text{g L}^{-1}$  have been found in traditional wells or tube-wells used by the population on a daily basis without having a clear knowledge of the situation. This arsenic originates from leaching of arsenic in sediments and volcanic rocks of geogenic origin (Muñoz et al, Ramos OE et al).

Preliminary results of an ongoing cross sectional study have confirmed the human exposure in some villages south from Poopó Lake. Concentration between 10 and  $150 \mu\text{g/L}$  were observed in tap water, traditional wells and tube-wells. The concentrations in collected urines samples, a marker of the total exposure through drinking water and food, confirmed exposure in the low to medium range, known to be associated with increased risk of adverse health effects.

The lack of knowledge by medical staffs of the region and the absence of overt symptoms will be discussed.

# COLOQUIO INTERNACIONAL SOBRE LA CONTAMINACIÓN ACTUAL E HISTÓRICA EN LOS ECOSISTEMAS ACUÁTICOS ANDINOS

La Paz, 3 al 5 de mayo de 2016  
Universidad Mayor de San Andrés, Cota Cota, La Paz

## **Proceedings**

**International colloquium on current and ancient contamination in  
Andes aquatic ecosystems**

**Coloquio internacional sobre la contaminación actual y histórica  
en los ecosistemas acuáticos Andinos**

**Colloque international sur la contamination actuelle et historique  
des écosystèmes aquatiques andins**

**La Paz – May 3<sup>rd</sup> – 5<sup>th</sup> 2016**

**Universidad Mayor de San Andrés – Campus de Cota-cota, La Paz**

## General Planning

- **May 3<sup>rd</sup> 2016: Contamination and eutrophication of Lake Titicaca**

*AM session: Mercury biogeochemistry and contamination of aquatic ecosystems of the Andes region*

Keynote Lecture: Hg contamination in Latin America: the past is not what we think, nor the future (J.-R. Davee Guimarães).

*PM session: Chemical contamination, eutrophication and monitoring of Lake Titicaca and its watershed*

Keynote Lecture: Eutrophication of the Cohana Bay (D. Acha).

- **May 4<sup>th</sup> 2016: Arsenic issues in the Andes**

*AM session: Arsenic biogeochemistry and contamination of aquatic ecosystems of the Andes region*

Keynote Lecture: Arsenic contamination of groundwater (Chile) (G. Lobos).

*PM session:*

*Workshop 1: Arsenic and mercury speciation.*

*Workshop 2: Paleoenvironmental studies in the Andean altiplano.*

- **May 5<sup>th</sup> 2016: Historical reconstructions of the human-climate interactions in the altiplano: implication of archeological purposes**

*AM session: Paleo-environmental reconstruction of Altiplano's archives*

Keynote Lecture: Holocene Paleoclimatic and Paleoenvironmental History of the Lake Titicaca Basin (S. Fritz & P. Baker).

*PM session: Archeology: historical human – environment interactions*

Keynote Lecture: Recent contribution of terrestrial and subaquatic archeological investigation in Lake Titicaca (C. Delaere & M-A. Vella).
