#### Abstract

Non-alcoholic fatty liver disease (NAFLD) is a hepatic disease associated with metabolic syndrome. NAFLD covers a spectrum of liver disease from steatosis to non-alcoholic steatohepatitis (NASH) and cirrhosis.

NASH is a disease evolving under the influence of various stimuli still poorly understood. In this paper we present new clinical decision support system (CDSS) for the diagnosis of NASH and the comparison of this system with machine learning algorithms.

#### Keywords:

Non alcoholic fatty liver disease, Liver Disease, Nonalcoholic steatohepatitis, clinical decision support system, knowledge representation.

#### Introduction

NAFLD is a clinical syndrome and pathologically characterized by diffuse macrovesicular fatty change in the hepatocytes. NAFLD includes simple nonalcoholic fatty liver disease, nonalcoholic steatohepatitis (NASH) and hepatic cirrhosis [1].

NASH is a disease evolving under the influence of various stimuli still poorly understood, but where insulin resistance prominently [2]. It is necessary to develop a knowledge-based system to diagnose NASH. In this paper we describe a new diagnosis support system based on validated knowledge from scientific literature and clinical practice guidelines (CPG) and comparison of this system with machine learning algorithms.

#### **Materials and Methods**

162 morbidly obese subjects involved in a gastric surgery program, prospectively recruited between 2005 and 2009 in the Department of Nutrition of Pitié-Salpêtrière.

Prediction analyses were performed using the following commonly used methods: logistic regression and fuzzy datamining. All algorithms were implemented within the R environment.

Case Based Fuzzy Cognitive Map (CBFCM) is a hybrid decision-making computing technique [3]. CBFCM is represented as nodes (concepts) that illustrate the different aspects of the system's behavior. The construction of CBFCM for the modeling of a medical decision making task is consisting of three parts: (a) to determine concepts and (b) to determine the strength of cognitive relationships between concepts (c) to explicit the fuzzy control rules [4].

#### Results

Logistic regression gives an accuracy of 77.3% and Fuzzy Data Mining gives an accuracy of 75%. With CDSS, the accuracy was 91.9% and gives AUROC=91.7%

#### **Discussion and conclusion**

On our data, prediction NASH with decision support system gives performance higher than logistic regression and fuzzy data mining. The conducted study allowed us to test cognitive approaches reasoning to enable personalized medicine.

#### Acknowledgments

We thank Dr Florence Marchelli. The constitution of the obese cohort and data base was funded by the (0702/Microbaria), French National Agency of Research (ANR Adipofib and ANR-IHU ANR-10-IAHU-05.) and European Union (FLIP\_FP7).

# Studies in Health Technology and Informatics

This book series was started in 1990 to promote research conducted under the auspices of the EC programmes' Advanced Informatics in Medicine (AIM) and Biomedical and Health Research (BHR) bioengineering branch. A driving aspect of international health informatics is that telecommunication technology, rehabilitative technology, intelligent home technology and many other components are moving together and form one integrated world of information and communication media. The series has been accepted by MEDLINE/PubMed, SciVerse Scopus, EMCare, Book Citation Index – Science and Thomson Reuters' Conference Proceedings Citation Index.

Series Editors:
