## ABSTRACT

The contents of Rare Earth Elements (REE) and titanium in various species of plants, in groundwaters and in soils from the ultramafic complex of Salitre, MG, Brazil, were determined. Due to the particular mineralogy of the bedrock, REE and Ti present high concentrations in the soils. The transfer factors of the REE from soil to plants were calculated, giving values ranging from 0.0001 to 0.0028, much lower than the values reported elsewhere in Brazil. Furthermore, as suggested by other authors, the levels of REE in the plants appears to be independent from the REE contents in the soils. The concentrations of the REE in the plants, normalized to chondrites contents, show patterns similar to those of the soils. The patterns obtained for the normalized REE contents in groundwaters suggest an influence of the plant root activity leading to an enrichment in heavy REE. Some plant species show an accumulation of titanium and present concentration values about three times higher than the average content in plants cited in the literature. I

## INTRODUCTION

In a recent past, little was known about the content of Rare Earth Elements (REE) in ecosystems. It was due to the very low concentrations of REE, mainly in biological samples,

Fonds Documentaire ORSTOM

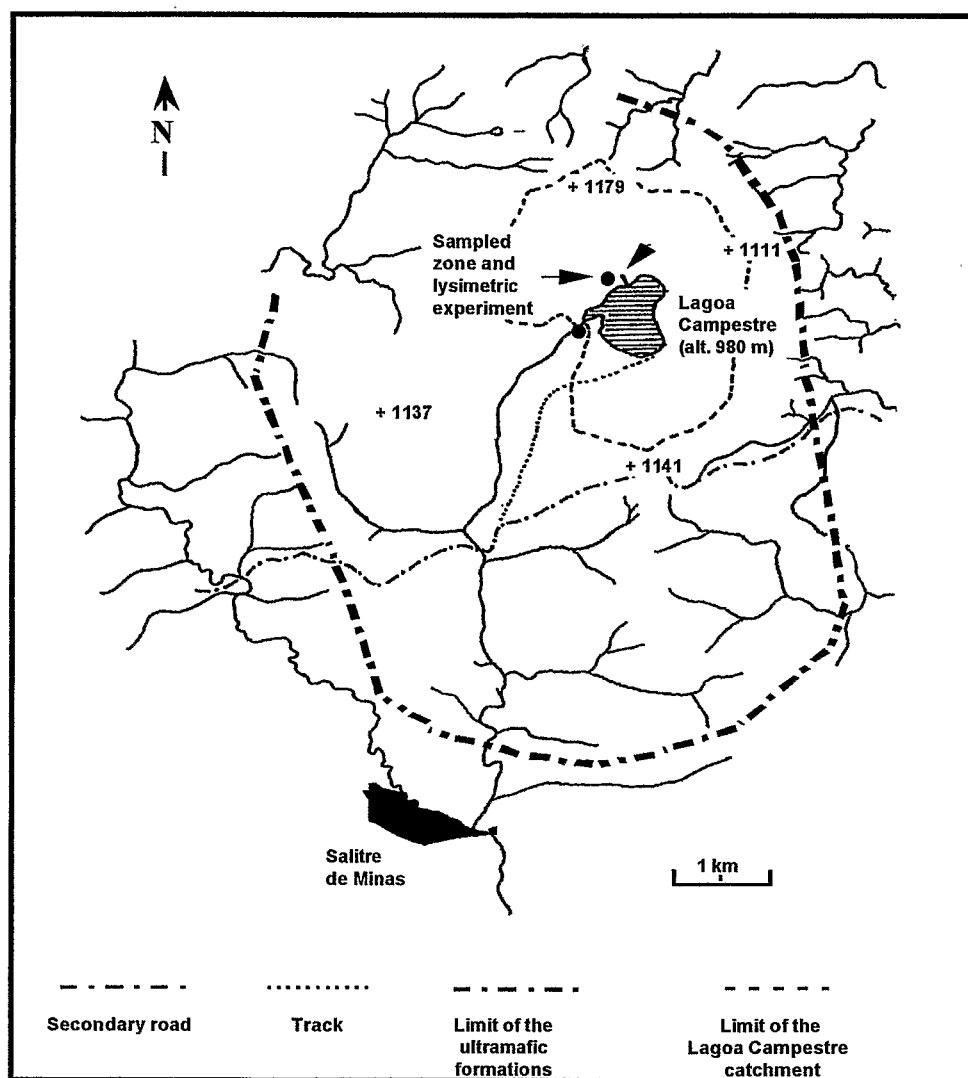

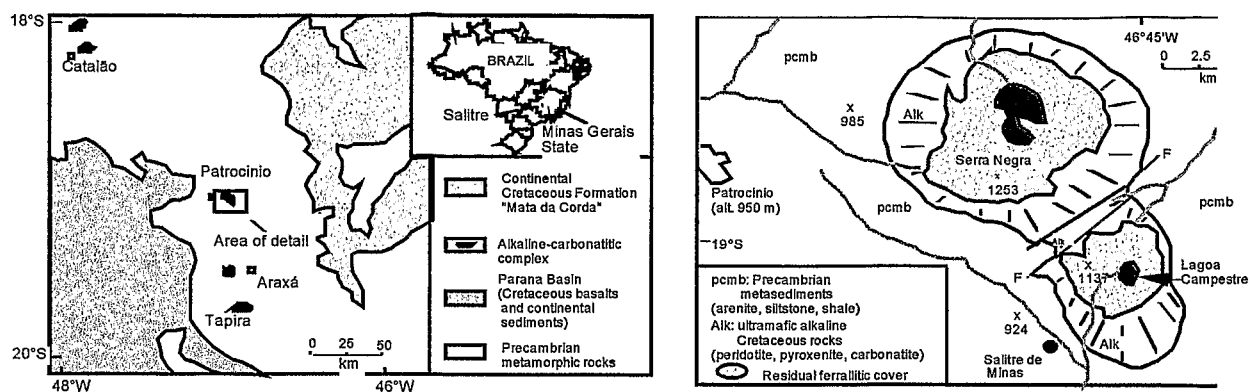

Figure 1. Localization of the Salitre area, geological context, drainage system, location of sampled zone and the lysimetric experiment (+1137= altitude in meters)

like plants, and to insufficient detection limits of the analytical methods (Brooks, 1972; Yliruokanen, 1975).

Since a few years, the development of highly sensitive analytical techniques allowed the precise and accurate determination of chemical elements which were formerly not detectable (Bowen, 1979), notably for the REE. Their concentration levels, behaviour and uptake by plants from soil have been investigated for the late few years (Caplan *et al.*, 1987; Markert *et al.*, 1989; Markert, 1992; Ichihashi *et al.*, 1992).

In tropical environments, little information is available about the concentration of REE in ecosystems, specially for regions with high REE levels in the soil. In Brazil, there is only one published study, for the species *Solanum lycocarpum*, in the ultramafic-alkaline complex of Catalão, GO, Brazil (Lima e Cunha *et al.*, 1993).

Several ultramafic complexes occur in the Alto Parnaíba area, in the West of Minas Gerais State, Brazil (Ulbrich & Gomes, 1981). One of these, the Salitre complex, presents REE and Ti at the percentage levels, due to its particular mineralogy. In the present work, the content of REE and Ti in leaves of various species of plants, in groundwaters and in soils from the region of Salitre were determined, aiming at the comprehension of the behaviour of REE and Ti in this ecosystem. The objectives of this work were: i) to verify if the plants growing in environments with high REE and Ti contents have higher concentrations of these elements than plants from non REE-Ti enriched soils; and ii) to evaluate the role of plant uptake on REE distribution pattern in groundwaters. For this research, the analytical techniques employed were Instrumental Neutron Activation Analysis (INAA) for the REE determination in soils and in plants, Inductively Coupled Plasma-Atomic Emission Spectrometry (ICP-AES) for the analysis of Ti, and Inductively Coupled Plasma-Mass Spectrometry (ICP-MS) for the groundwater analysis.

## **MATERIAL AND METHODS**

### **Study area**

The Salitre complex comprises mainly micaceous pyroxenites ("bebedourite"), peridotites and carbonatites. The intense leaching of these rocks originated a thick and loose lateritic cover (50-100 m), which covers the major part of the complex. This lateritic layer presents a central depression ("Lagoa Campestre") partially filled by sediments and occupied

by a peaty lake (fig.1). The sampling area for leaves, water and soil is located about 30 m north of this lake.

Due to the particular mineralogy of the original rocks, which contains perovskite, apatite and calzirtite, these alterites present high contents in REE (up to 5%  $\Sigma R_2O_3$ ), in  $TiO_2$  (up to 30%), in  $ZrO_2$  (up to 1 %) and  $Nb_2O_5$  (up to 1 %). The original vegetation consists of semideciduous forest and brazilian savanna ("cerrado"). Nowadays, the cover is a mosaic of largely modified physionomies of "cerrado", due to human activity (coffee and ranch). The most conspicuous features of this vegetation are the tortuosity of the trees and the leaf stiffness. The presence of thick barks and many kinds of underground organs make the trees resistant to fires that occurs very frequently in this vegetation.

The climate is tropical, characterized by a mean annual temperature of about 20 °C and a rainfall of  $\pm 1,500$  mm; the length of the dry seasons reaches five months, from July to November.

## **Sampling and analytical procedures**

### *Groundwater and soil*

A pan-type lysimetric experiment (a trench about 3 m length, 1 m width, 1.5 m depth) was installed under a secondary "cerrado" cover, weakly disturbed by anthropic activity (fig. 1). The lysimeter has two types of collectors: 1). cylindrical lysimeters consisting of tubes of different lengths (10, 25, 45, 85 cm) containing undisturbed soil. 2). plate collectors, consisting of a flat recipient with a diameter of 25 cm, settled at the same depths as the former type. Both collectors were linked to funnels that lead the leachates to storage flasks. All parts of the lysimeter were made of plastic, to avoid contamination. On the one hand, the soil inside of the cylindrical lysimeters was isolated from the surrounding soil, so it was not penetrated by roots and the collected leachates represent 80-95 % of the rainwater drained vertically. On the other hand, the plate collectors do not prevent the root penetration and their adsorption activity, and collect only rapid circulating water, representing 2-10 % of rainwater (Chauvel *et al.* 1989, Sondag *et al.*, 1996).

Water sampling was performed during the dry season (June-November 1993) and at the end of the rain season (March 1994). The samples were filtered using a Millipore® 0.2  $\mu m$  cellulose acetate filters and acidified with nitric acid for REE and trace element analysis. The REE were analysed by ICP-MS using  $^{115}In$  and  $^{187}Re$  as internal standards. The SLRS 2

standard water sample was taken as reference material using REE values obtained by neutron activation analysis.

Soils were sampled in a trench near the lysimetric experiment and in four other profiles around the "Lagoa Campestre". Four samples were taken from each profile at depths of 10, 25, 45 and 85 cm. Ti and other major and traces elements, including REE, were determined using ICP-AES after a mixed  $\text{HClO}_4$  - HF digestion. REE were determined by INAA, as described below for the analysis of plants. The accuracy of the method was checked by the analysis of the geological reference materials UBN and GS-N. The precision ranges from 1.5 to 2.5 % for major elements and from 4 to 8% for traces elements.

#### *Sampling and analysis of plant material*

Plants were collected during the dry season (August 1993) in a area of about 100 m<sup>2</sup> around the lysimeter. The 12 most frequent species were chosen in a broad variation of tropical plant families (table 3). Sampling was performed in such a way that at least 1 g of ashes was obtained for each species, so 300-500 g of fresh leaves (50-100 g when dry) were collected. One or many individuals of each species were sampled. The leaves were washed many times with abundant deionized water, dried (30°C), and homogenized in a blender. The grinded samples were put into ceramic capsules, dried (105°C for 24 h), weighted and ashed in a electric oven at 450°C for 12 h (Brooks, 1972).

For the analysis by INAA, aliquots of standard solutions with known concentrations of the analysed REE were pipetted onto a 1 cm<sup>2</sup> piece of Whatman® No. 40 filter paper and evaporated to dryness under an infrared lamp. Samples (200 mg) and standards were sealed in a plastic envelope and irradiated for 8 hours at a thermal neutron flux of  $10^{12}$  n cm<sup>-2</sup> s<sup>-1</sup>, at the IEA-R1 nuclear reactor of the Instituto de Pesquisas Energéticas e Nucleares (IPEN-CNEN/SP). The measurements of the induced gamma-ray activity were carried in a GMX hyper-pure Ge detector, connected to an ADCAM 100 Multichannel Buffer (EG&G ORTEC) and to a personal computer. The resolution (FWHM) of the system was 1.90 keV for the 1332 keV gamma ray of <sup>60</sup>Co. The gamma ray spectra were processed using the program VISPECT, developed at IPEN by Dr. Denis Piccot, from Saclay, France. Two series of countings were performed, the first one five days after irradiation, for the determination of La, Sm and Nd, and the second one 15 days after irradiation, for the determination of Ce, Eu, Tb, Yb and Lu. The counting times were about 3 hours. The precision and accuracy of the method were verified by the analysis of the reference materials "Citrus Leaves" and "Pine Needles"(NIST).

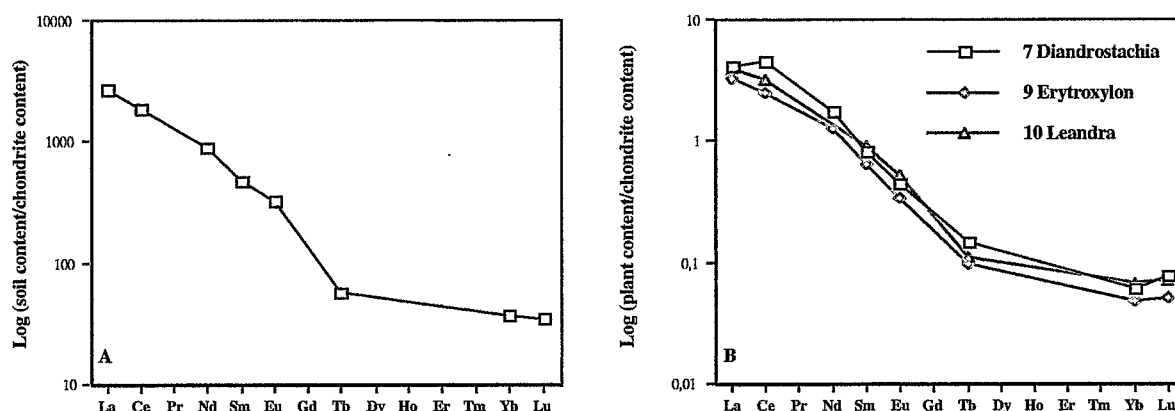

## RESULTS

The results obtained for the REE and Ti contents of different soil profiles from the region of Lagoa Campestre are presented in table 1. Owing to the great homogeneity of REE values in the different studied profiles, only the average values of these soil samples are presented.

**Table 1.** Average rare earth elements<sup>a</sup> and Ti<sup>b</sup> concentrations in soil profiles from the region of Lagoa Campestre; (N=20) (mg Kg<sup>-1</sup>)

**Figure 2.** REE contents in soil (A) and plants (B) from Lagoa Campestre region normalized to chondrites content.

The high levels of REE and Ti in the study region is well reflected by the observed values.

In the table 2, the values obtained for the reference materials Pine Needles (NIST 1575) and Citrus Leaves (NIST-1572) are shown, along with the proposed values (NIST, Markert & De Li, 1991). The results are in good agreement with reference values. The reproducibility of the method was tested by six replicate analysis of the sample and the errors associated with the data represent one standard deviation. The elements Tb and Lu presented higher standard deviations (33 %). This is due to the low concentrations of these elements in plants and to their nuclear characteristics, that are not so favourable to activation analysis as the others determined REE.

<sup>a</sup> - INAA; <sup>b</sup> - ICP-AES

In table 3, the values obtained for the concentration of REE in the studied plant leaves are presented (mean of 3 determinations). The average contents in plants (Markert, 1992) are also presented. It can be seen that, for the REE, in general, the values obtained agree with the average contents in plant. Interestingly, the species *Diandrostachia chrysotrix*, *Erythroxylum sp* and *Leandra aurea* show the highest REE concentrations, specially for the light REE (La to Eu), and the species *Stryphnodendron adstringens* presented the lowest REE contents.

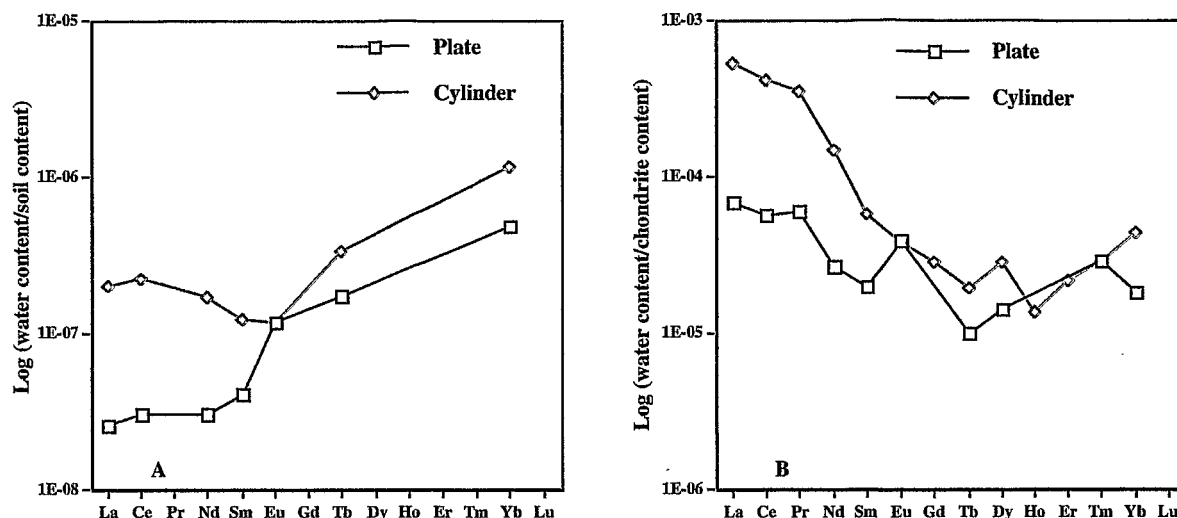

In a study of the content of REE in the species *Solanum lycocarpum* in a similar ecosystem, the alkaline-ultramafic complex of Catalão, GO, Brazil, Lima e Cunha *et al.* (1993) found a very high concentration of REE (600 to 6000 mg Kg<sup>-1</sup> in the ashes), much higher than the data obtained in the present work (3 to 200 mg Kg<sup>-1</sup>).

The transfer factors for REE from soil to plant were calculated by dividing the REE concentration in the plant by the REE concentration in the soil (Markert and De Li, 1991). The obtained factors ranges between 0.0001 and 0.0028, at least ten times lower than the range reported by Markert and De Li (1991) for a natural forest ecosystem (0.041-0.088). This is in agreement with the hypothesis of Markert (1987) that the levels of REE in plants are independent from those of the pedologic substratum; as a result, the high REE level in the soil of the “Lagoa Campestre” area induces low concentration factors for these elements in the plants.

For the comprehension of the diagenesis of REE, the Masuda-Coryell diagram (Masuda, 1962; Coryel *et al.*, 1963) is often used in geochemical studies. It consists in normalizing the REE contents in samples against the REE contents in chondrite meteorite, which is used as a reference ( $\log[\text{REE soil content}/\text{REE chondrites content}]$ ). The concentration values of REE in the chondrites used are those reported by Boynton (1984). The chondrite-normalized patterns of mean soil value and of the species *Diandrostachia chrysotrix*, *Leandra aurea* and *Erythroxylum sp*, which present the highest REE contents, are shown in fig. 2 a and b. It can be seen that the studied plants present diagrams very similar to those of the soil, with a high content in light REE (LREE) and a lower one for heavy REE (HREE).

For a better understanding of the relationship between the REE in all studied species and the REE concentrations in the soil, data were also normalized to the mean REE contents in the soils of the area; the obtained diagrams are shown in figure 3. The nearly flat distribution

patterns indicate that, in general, the REE keep in the plants the same distribution as the one found in the soil.

**Figure 4.** REE contents in groundwater from Lagoa Campestre region normalized to soil (A) and chondrites (B) content.

**Table 4.** Rare earth elements concentrations in surface waters collected in the lysimeter (10 cm depth), by ICP-MS ( $\mu\text{g L}^{-1}$ )

Collector Type	La	Ce	Pr	Nd	Sm	Eu	Gd	Tb	Dy	Ho	Er	Tm	Yb	Lu
Plate	0.023	0.049	0.007	0.017	0.004	0.003	-	0.001	0.005	-	0.001	0.001	0.004	-
Cylinder	0.18	0.366	0.042	0.096	0.012	0.003	0.008	0.002	0.010	0.001	0.005	0.001	0.01	-

The results obtained for the REE concentrations in groundwaters sampled in the two different types of collectors are shown in table 4. For this study, only the waters collected in the superficial horizon (10 cm depth) are considered because the roots are mainly active at this level in the studied area. The sum of REE ranges from 0.2 to  $0.08 \mu\text{g L}^{-1}$ . The distribution patterns of the REE in superficial water normalized both to the soils and to the chondrites content are shown in figure 4 a and b respectively. The soil-normalized pattern is different from that observed for the plants and the soils; it indicates an enrichment in HREE in the waters with respect to mean soil value. This tendency is mainly evident in the water collected in the plate-type collector, which is much more affected by the root activity. The chondrite-normalized pattern for this part is more or less similar to those obtained for the soil and plants.

The species *Lamanonia ternata*, *Qualea grandiflora* and *Gochnatia polymorpha* present Ti concentrations much higher than the reference values (table 3). Actually, *Qualea* as well as other Vochysiaceae, are already known as aluminium accumulator (Kukachka & Miller,

1980). Ti is one of the so called "high field strength elements" (Hall & Plant, 1992), usually presenting a weak mobilization by weathering processes. Therefore, a high Ti accumulation was not expected in the plants, even with the high Ti soil content.

## CONCLUSIONS

Despite the high levels of REE found in the soils, plants growing in the alkaline-ultramafic complex of Salitre, in a tropical environment, generally present REE concentrations within the ranges usually found in plants. The highest REE contents are found in species *Diandrostachia chrysotrix*, *Leandra aurea* and *Erytroxylum* sp. However for every species, the transfer factor from soil to plant is at least ten times below the range reported in the literature, confirming that the concentration of REE in the plants are widely independent of the soil content. All species present normalized patterns similar to those of the soils, characterized by an enrichment in LREE. One should also notice that in the studied area, *Lamanonia ternata*, *Qualea grandiflora* and *Gochnatia polymorpha* present Ti concentrations about tree times higher than the reference values.

Our results suggest also that in the studied ecosystem the metabolism of plants affect the REE distribution in the groundwaters, leading to an enrichment of the surficial waters in HREE.

## ACKNOWLEDGMENTS

The authors wish to thank B. Dupré for support in waters anlysis, M. Meguro for the use of her laboratory to prepare plant analysis, P. Magat and H. L. Ozorio F. for field assistance. This work was supported by French ECOFIT Program (ORSTOM-CNRS) and, in Brazil, by FAPESP: Projeto Tematico, processo 91/3518-0.

	 <b>VOLUME</b> Pages	 <b>CD-ROM</b> Name of the file in D:\DATA\communic\
 1. Effects of heavy metals in the environment on human health A.M. BERNARD	21	001.PDF
 2. Behaviour of trace elements in terrestrial ecosystems S.P. MCGRATH	35	002.PDF
 3. In situ procedures for measuring chemical speciation and availability of trace metals in soils and sediments W. DAVISON, H. ZHANG, S. MILLER	57	003.PDF
 4. Critical evaluation of selective extraction methods for soils and sediments M.I. SHEPPARD, M. STEPHENSON	69	004.PDF
 5. Estimating Cu <sup>2+</sup> and Pb <sup>2+</sup> activities in soils T.A. TAWFIC, W.L. LINDSAY		005.PDF
 6. Speciation of dissolved selenium in soil solutions K.J. REDDY, Z. ZHANG, S.P. GLOSS		006.PDF
 7. Determination of Cr(VI) in soils by differential pulse polarography - Influence of pH and organic matter content on Cr(VI) reduction S. CRAM, W.R. FISCHER, B.S. CASTILLO, M. GUTIERREZ, V.L. FLORES		007.PDF
 8. Measurement and behavior of indigenous levels of the free-hydrated cations of Cu, Zn and Cd in the soil-water system P. A. HELMKE, A.K. SALAM, Y. LI		008.PDF

9. Extended X-ray absorption fine structure study of mercury speciation in a flood plain soil  
Z. WANG, D. HESTERBERG, W. ZHOU, D.E. SAYERS, W.P. ROBARGE  
009.PDF
10. Direct determination of heavy metal speciation in soils by EXAFS spectroscopy  
A. MANCEAU, J.C. HARGÉ, G. SARRET, J.L. HAZEMANN, M.C. BOISSET, M. MENCH, PH. CAMBIER, R. PROST  
010.PDF
11. The structure of nickel surface precipitates on pyrophyllite  
A.M. SCHEIDEGGER, G.M. LAMBLE, D.L. SPARKS  
011.PDF
12. Differential FTIR study of pyrophosphate extractable material of soils: implication in Cd-bonding sites and availability  
G.S.R. KRISHNAMURTI, P.M. HUANG, K.C.J. VAN REES, L.M. KOZAK, H.P.W. ROSTAD  
012.PDF
13. Sequential chemical extraction of trace elements: Development and use in remediating contaminated soils  
W.R. BERTI, S.D. CUNNINGHAM, L.W. JACOBS  
013.PDF
14. Determination of mercury-phases in contaminated soils and sediments by solid-phase-Hg-pyrolysis  
H. RIESTER, G. MÜLLER  
014.PDF
15. Sequential extraction of trace metals in a contaminated dredged sludge in Northern France  
V. RUBAN  
015.PDF
16. Characterisation of Pb-, Zn-, Cd-, and Cu-bearing phases in river sediments by combined geochemical and mineralogical techniques  
K. HUDSON-EDWARDS, M. MACKLIN, C. CURTIS, D. VAUGHAN  
016.PDF
17. Determination of the acid extractable metal fraction in a sediment with a high carbonate content: a critical evaluation  
F.M. TACK, M.G. VERLOO  
017.PDF

18. Solid-phase forms of cadmium in sewage sludge treated soils during a two-year residual period  
P.S. HOODA, B.J. ALLOWAY  
018.PDF
19. Residual effect of organic matter on cadmium uptake by plants and its distribution in soils  
B.R. SINGH, R.P. NARWAL, A. ALMAS  
019.PDF
20. Spéciation du sélénium dans les sols  
Cas d'un sol Irlandais sélénifère  
F. SEBY, M. POTIN GAUTIER, M. ASTRUC  
020.PDF
21. Speciation of lead in a soil amended with an urban compost  
N. VALENTIN, P. PRUDENT, A. PRONE, M. DOMEIZEL, C. MASSIANI  
021.PDF
22. An efficient method for estimating bioavailability of arsenic in soils: a comparison with acid leachates  
J.C. NG, A. HERTLE, K.W. MCDOUGALL, A.A. SEAWRIGHT  
022.PDF
23. PGAUSS: A computer program to evaluate stability constants of proton and metal-humates from potentiometric titration data  
B. MANUNZA, S. DEIANA, C. GESSA  
023.PDF
24. Human impact on coral reef ecosystem at Mauritius island (Indian Ocean) : Trace elements in littoral ecosystem  
S. BROCCO, C. BECK  
024.PDF
25. Biogeochemistry of the trace elements in the landscapes of the Wooded Steppe within the Central Chernozemic District of Russia  
N.A. PROTASOVA  
025.PDF
26. The mobilisation of trace elements in soils  
B.J. ALLOWAY  
026.PDF
27. Migration of Cd, Cu, Ni and Pb in low-permeable clay-type solids in presence of acid complexants  
M. SAGER  
027.PDF

28. Ni and Al mobilization along a soil pH transect in forest soils of the Günser Mountains, Austria  
W. W. WENZEL, W. E. H. BLUM, A. BRANDSTETTER, R. S. SLETTEN, G. WIESHAMMER  
028.PDF
29. Modeling the fate of heavy metal ions in soil: competition between humic acids and olive mill wastes for the binding of Cu(II), Pb(II), Mn(II), and Zn (II) ions. A study with the bimodal gaussian distribution model.  
B. MANUNZA, V. SOLINAS, S. DEIANA, C. GESSA  
029.PDF
30. Evidence for the leaching of surface deposited cadmium in agricultural soils  
F. A. NICHOLSON, K. C. JONES, A. E. JOHNSTON  
030.PDF
31. Possibilities for predicting mobility of trace elements in soils via modeling.  
W. H. VAN RIEMSDIJK, M. F. BENEDETTI, T. HIEMSTRA  
147  
031.PDF
32. Isotherms for sorption of cadmium onto soil, as functions of soil water composition  
V. PALM  
032.PDF
33. Humic substances and the bioavailability of metal ions: from the model to the field.  
M. F. BENEDETTI, W. H. VAN RIEMSDIJK, L. K. KOOPAL, D. G. KINNIBURGH, C. O. J. MILNE  
033.PDF
34. Disponibilité du nickel dans les sols développés sur roches ultramafiques de Nouvelle-Calédonie.  
T. BECOUER, E. BOURDON, L. L'HUILLIER  
034.PDF
35. Cadmium and zinc sorption by tropical soils as affected by chemical degradation  
M. T. PARDO, M. E. GUADALIX, C. LÓPEZ-FANDO  
035.PDF
36. Behaviour of zinc sulphide in absence and presence of humic acid and / or cadmium  
P. CAUVENBERG, A. MAES  
036.PDF
37. Copper and lead sorption by different fractions of two Sardinian soils  
G. ALBERTI, A. CRISTINI, A. LOI, P. MELIS, G. PILLO  
037.PDF

38. Mobilization of trace metals in contaminated soils under anaerobic conditions  
R. CHARLATCHKA, P. CAMBER, S. BOURGEOIS  
159  
038.PDF
39. Soil pollution and crop contamination by antimony from historical mine dumping - Analysis and assessment of mobility -  
W. HAMMEL, R. DEBUS, L. STEUBING  
039.PDF
40. Determination of trace elements in peat soils by X-Ray fluorescence spectroscopy  
J. OMOTE  
040.PDF
41. Effets à long terme de la minéralisation des Zostères sur les concentrations en métaux des sédiments.  
J. C. WASSERMAN, J. C. DUMON, M. A. M. WASSERMAN  
041.PDF
42. Plant uptake and geochemical phase distribution of Cd, Pb and Zn from soils after application of baghouse dust from the electric arc furnace production of steel.  
J. H. RULE, D. C. ADRIANO  
175  
042.PDF
43. Heavy metal uptake by *Lolium italicum* and root mortality as affected by salt water irrigation  
H. M. HELAL, A. RAMADAN, F. AZAM  
189  
043.PDF
44. Plant uptake of Cd through arbuscular mycorrhiza, an important group of symbiotic fungi  
E. J. JONER, C. LEYVAL  
195  
044.PDF
45. Effect of sewage-sludge on heavy metals accumulation in soil and wheat (*Triticum aestivum* L.)  
A. FIGLIOLA, D. MANGIONE, C. IZZA, L. LETTA, G. BRAGATO, M. DE NOBILI  
045.PDF
46. Accumulation of trace metals in crop cultivated on polluted soil after herbicide treatment  
E. MITEVA, S. V. MANEVA, P. BOJINOVA, J. IVANOVA  
046.PDF
47. Rare earth elements and titanium in plants, soils and groundwaters in the alkaline-ultramafic complex of Salitre, MG, Brazil.  
G. CECCANTINI, A. M. G. FIGUEREDO, F. SONDAG, F. SOUBIÉS  
047.PDF

48. Modelling subsurface element fluxes and concentrations  
G. DESTOUNI  
209  
048.PDF
49. Adsorption-desorption and transport of copper in soils.  
H.M.SELIM, L.MA, H. ZHU, M. C. AMACHER,  
I.K. ISKANDAR  
223  
049.PDF
50. Mobility of cadmium in sandy soils; effects of complexation and competition  
E.J.M. TEMMINGHOFF, S.E.A.T.M. VAN DER ZEE,  
F.A.M. DE HAAN  
233  
050.PDF
51. Arsenic in Swiss soils and waters and their relation to rock composition and mining activities  
H-R. PFEIFER, J. HANSEN, J. HUNZIKER, D. REY,  
M. SCHAFER, V. SERNEELS  
051.PDF
52. Cut-off effect of water movement by hydrophobic sand on metal migration in soil  
C. MIZUNIIWA, Y. AMEMIYA, S. YABASHI, M. CHINO  
052.PDF
53. Caractérisation et analyse de la mobilité et de la biodisponibilité du nickel dans les sols agricoles : Le cas du Pays de Gex, Ain, France  
C. BUATIER, J. WIART  
053.PDF
54. Use of microcosms for studies of heavy metal transport in the soil - plant system  
B.O. BERTHELSEN, E. STEINNES, A. FJELLVIKAAS  
054.PDF
55. Origin and spacial and vertical distribution of Cd and Cr in sediment cores in Vigo Ria (Spain).  
M.L. ANDRADE, P. MARCET, M.J. MONTERO  
055.PDF
56. Selenium uptake and partitioning in tomato plants in relation to sulphate concentration in soil  
B. PEZZAROSSA, G. PETRUZZELLI, D. PICCOTINO,  
F. MALORGIO, C.J. HILLHOUSE, J. JONES, C. SHENNAN  
056.PDF
57. Effects of decreased cellular glutathione levels on growth, membrane integrity and lipid peroxidation in roots of copper-stressed *Silene vulgaris*  
H. SCHAT, R. VOODS  
057.PDF

58. Metals and trees: impacts, responses to exposure and exploitation of resistance traits  
N.M. DICKINSON, N.W. LEPP  
247  
058.PDF
59. Patterns of soil copper contamination and temporal changes in vegetation found in the vicinity of a copper rod-rolling factory  
N.W. LEPP, J. HARTLEY, M. TOTI, N.M. DICKINSON  
059.PDF
60. Trace elements in plants and soils of urban parks (Florence, Italy)  
C. BINI, L. GENTILI, L. MALECIBINI, O. VASELLI  
060.PDF
61. Instrumental multielement analysis of environmental samples  
B. MARKERT  
061.PDF
62. Effects of abandoned mercury mines on terrestrial and aquatic ecosystems  
R. BARGAGLI  
255  
062.PDF
63. Teneurs foliaires en métaux lourds de Peuplier, Frêne, Robinier en présence de boues d'épuration : valeur comme bioindicateurs de pollution  
M. BONNEAU, J. GARBAYE, F. LE TACON, J. BOUCHARD,  
M. BITSCH  
267  
063.PDF
64. Lead and cadmium distribution in urban soil and plants in the city of Rome: a preliminary study.  
M. ANGELONE, C. TEOFILI, G. DOWGIALLO  
064.PDF
65. Soil microbial biomass content of sewage sludge-treated agricultural land  
S.R. SMITH  
065.PDF
66. Chicory (*Cichorium intybus* L.) as bioindicator of heavy metal contamination  
L. SIMON, J. PROKISCH, B. KOVÁCS  
066.PDF
67. Some secondary metabolites altered by heavy metals  
A.M. ZOBEL, K. WIERZCHOWSKA-RENKE, S.A. BROWN,  
B. PRIMEAU, J. LYNCH, M. KURAS, R. CRANG,  
J.E. NIGHSWANDER  
067.PDF

68. Cellulase activity in heavy-metal polluted soils  
S. KANAZAWA  
068.PDF
69. Extractable fractions of heavy metals in forest soil pedons, Ontario, Canada  
A. CHLOPECKA, T. HUTCHINSON  
069.PDF
70. Compound pollution of Cd, Pb, Zn, As, in plant soils system and its prevention  
Y. WU  
070.PDF
71. Factors influencing heavy metal concentrations in small lakes  
E. STEINNES  
279  
071.PDF
72. Biogeochemical cycling of trace elements in a meromictic lake  
M. TAILLEFERT, E. ROSE, J.-F. GAILLARD  
289  
072.PDF
73. Early diagenesis of contaminated Seine river sediments: a laboratory experiment  
A.-L. BUSSY, A. ESTÈBE, A. COMBLÉZ, J.-M. MOUCHEL, D.R. THÉVENOT  
073.PDF
74. Lead and cadmium availability in soils under waterlogged and air-dry conditions  
I. PHILLIPS, M. GREENWAY  
074.PDF
75. Concentration of copper in sediments and fishes from Kaohsiung River and its Harbor area, Taiwan  
M.H. CHEN, H.T. WU  
075.PDF
76. Metal distribution in a sub-tropical coastal lagoon: a statistical approach  
M.A.M. WASSERMAN, C. LATOUCHE, J.C. WASSERMAN  
076.PDF
77. An experimental study on cadmium accumulation in water fern (*Salvinia rotundifolia* Willd.) plants  
W.H. ORNES, K.S. SAJWAN  
077.PDF
78. Teneurs métalliques et organiques dans les sédiments et effets sur les communautés benthiques dans deux cours d'eau représentatifs de la Région Nord/Pas-de-Calais  
F. GRUMAUD, S. DEMUYNCK, A. LEPRETRE, N. DHANAUT-COURTOIS  
078.PDF

79. Indicateurs écologiques et bioaccumulateurs en milieu marin : invertébrés benthiques des zones estuariennes et portuaires de la région Nord/Pas-de-Calais  
R. ROMONT, N. DHANAUT-COURTOIS  
079.PDF
80. Cadmium in soil and plants and its cycling in sheep-grazed hill country pastures  
A. ROBERTS, R. LONGHURST, M. BROWN  
303  
080.PDF
81. Cadmium and lead elimination through milk in the ewe  
P. HOUPERT, S. MEHENNAOUL, B. FEDERSPIEL, G. MILHAUD  
317  
081.PDF
82. Transfer of radiocaesium, plutonium and americium to sheep after ingestion of contaminated soil  
A.I. COOKE, D.L. RIMMER, T.E.C. WEEKES, N. GREEN, B.T. WILKINS  
082.PDF
83. Teneurs élevées en cadmium dans des chevaux polonais  
F. JANIN, G. SCHNITZER  
083.PDF
84. The potential pathways of plants contamination in the emission region of Copper Foundry "Glogów"  
J. ROSADA, B. CHUDZINSKI  
084.PDF
85. Pollution par des métaux et du fluor découlants d'établissements industriels d'extraction, dans une aire agricole.  
P. MEIS, C. SENETTE  
085.PDF
86. Accumulation of Pb, Cd and Zn from contaminated soil to various plants and evaluation of soil remediation with indicator plant (*Plantago lanceolata* L.)  
M. ZUPAN, V. HUDNIK, F. LOBNIK, V. KADUNC  
325  
086.PDF
87. Transfer of Cd, Cu, Ni, Pb and Zn from sewage sludge-treated soils into the edible parts of wheat, carrots and spinach  
P.S. HOODA, B.J. ALLOWAY  
087.PDF

88. Distribution of  $^{99}\text{Tc}$  in parts of winter wheat grown on contaminated soil  
G. ECHEVARRIA, P.C. VONG, C. VALENTIN-RANC, J.L. MOREL  
088.PDF
89. Chronic lead transfer from polluted soils to humans by means of inhalation and ingestion  
O. FEENSTRA, G. PRIDNIG, G. ROIDER, G. DRASCH  
089.PDF
90. Adverse health effects due to soil and water acidification - A Swedish research program  
A. OSKARSSON, M.-L. HEIKENSTEN  
090.PDF
91. A study on selenium in tobacco from some area of China  
M. WANG  
091.PDF
92. Accumulation of heavy metals in soil: The *Sustainability Approach* illustrated with a case-study on SSO-compost application  
S.W. MOOLENAAR, F.A.M. DE HAAN, T.M. LEXMOND, S.E.A.T.M. VAN DER ZEE  
092.PDF
93. Particulate matter and transfer of K, Cu, Al and Fe in the soil solutions of a podzol: preliminary results on semi-quantitative and qualitative approaches  
C. KELLER, D. MAVROCORDATOS  
093.PDF
94. A review of the biogeochemistry of tin in soil-plant systems  
R. EDWARDS  
094.PDF
95. Lead isotope characterization of heavy metal polluted soils in the Harz Mountains, Germany  
J. LÉVÊQUE, H. HEINRICHS, U. HAACK, F. ANDREUX, M. AMIOT  
095.PDF
96. Teneurs en Micro-polluants métalliques de sols localisés à Paris (Champ de Mars)  
F. LEMAIRE, G. SINTES  
096.PDF
97. Bilan et transfert des éléments traces sous écosystème forestier et sous monoculture de maïs  
F. JACQUIN, J.-L. MOREL, F. LE TACON, S. SULÇE  
097.PDF

98. Use of the dissolved Rb/Sr ratio as a pollution indicator  
P.M. NIREL, R. REVACLIER, G. PFISTER  
098.PDF
99. On pathways of Mn and Zn deposited in subalpine forests in southern Quebec, Canada  
Z.Q. LIN, P.H. SCHUEPP, N.N. BARTHAUR, G.G. KENNEDY, R.S. SCHEMENAUER  
099.PDF
100. The cumulation and translocation of Cu, Zn, and S in the soils polluted by copper smelter  
J. DROZD  
100.PDF
101. Contamination and pollution of soils in the Czech Republic  
E. PODLEŠAKOVÁ, J. NEMECEK  
101.PDF
102. Trace elements and some problems of medical ecology of Ukraine  
L.V. GERBILSKY, V.V. OGORODNY  
102.PDF
103. Issues of risk assessment and its utility in development of soil standards: the 503 methodology an example  
J.A. RYAN, R.L. CHANEY  
103.PDF
104. Action values for mobile ( $\text{NH}_4\text{NO}_3$ -extractable) trace elements in soils based on the German national standard DIN 19730  
A. PRÜEß  
104.PDF
105. An approach for predicting trace metal uptake by vegetables grown in contaminated soils  
I.D. MARTIN, C.C. FERGUSON  
105.PDF
106. Dutch methodology for risk assessment of contaminated soils  
R.M.C. THEELEN, A.G. NIJHOF, H. BOMER  
106.PDF
107. Factors of contamination of garden soils by heavy metals  
C. SCHWARTZ, K.D. FETZER, J.L. MOREL  
107.PDF

108. Quantifying community exposure and risk from heavy metals: a source category case study  
L. LEVIN, D. PORCELLA  
108.PDF
109. Aide multicritère à la décision et hiérarchisation de sites pollués : exemple d'application  
B. CÔME, S. EL MAGNOUNI, J. RICOURE, J. P. SAUTY  
109.PDF
110. Assessment of the risk of heavy metal mobilization in calcareous agricultural soils.  
C. PÉREZ SIRVENT, J. MARTÍNEZ SÁNCHEZ, C. GARCÍA RIZO  
110.PDF
111. Efficacité d'une méthode de digestion par micro-ondes pour la détermination de Fe, Mn, Zn, Cu, Pb, Cr, Al et Cd dans les sédiments  
P. MARCET, M.L. ANDRADE, M.J. MONTERO  
111.PDF
112. Risk assessment method for soils contaminated by heavy metals. Application to plants as targets.  
F. CELARDIN  
112.PDF
113. Soil protection in the Netherlands: the continuing story  
J.J. VEGTER  
433  
113.PDF
114. New standards on contaminated soil in Switzerland - comparison with Dutch and German quality criteria  
M.K. VOLLMER, S.K. GUPTA, R. KREBS  
445  
114.PDF
115. Sites et sols pollués  
A. STREBELLE  
459  
115.PDF
116. The regulation of sewage sludge application on land in the Netherlands and in the USA  
K. VERLOOP, J. VAN WENSEM, J.J. VEGTER  
116.PDF
117. Priority ranking on contaminated sites in France: Definition of danger and mobility scores  
J.M. OOSTERBAAN  
117.PDF
118. Pollution prevention policies for agricultural soils in the Netherlands  
H. SMIT  
118.PDF

119. Soil contamination and remediation: philosophy, science and technology  
D.C. ADRIANO, A. CHLOPECKA, D.I. KAPLAN, H. CLUSTERS, J. VANGRONSVELD  
465  
119.PDF
120. Plant based soil remediation: preliminary study of Pb phytoextraction from Pb-contaminated soils  
J.W. HUANG, S.D. CUNNINGHAM, S.J. GERMAN  
120.PDF
121. Potential applications of synthetic zeolites for *in situ* land reclamation  
I. REBEDEA, R. EDWARDS, N.W. LEPP, A.J. LOVELL  
121.PDF
122. Use of willow clones with high Cd accumulating properties in phytoremediation of agricultural soils with elevated Cd levels  
M. GREGER, T. LANDBERG  
505  
122.PDF
123. Immobilization of contaminants with in-situ calcite precipitation: A preliminary evaluation  
E.M.H. VAN PROOSDIJ, K.J. REDDY  
123.PDF
124. Redistribution of Cu, Cr and As in a Portuguese polluted soil during electrokinetic remediation  
A. RIBEIRO, A. VILLUMSEN, B. JENSEN, A. RÉPÉGA, J.M. VIEIRA E SILVA  
124.PDF
125. Use of chelating agents for soil-metal decontamination  
K. MOBLEY, I.K. ISKANDAR, H.M. SELIM  
125.PDF
126. Evaluation du taux de contamination d'un sol pollué et de son assainissement par la valorisation des processus naturels d'autoépuration  
P. ARRIZABALAGA, M. DUMAS, J. FAVET, C. DELODDERE, P. TISSOT  
126.PDF
127. Etude préalable à la décontamination d'un sol pollué par un produit de traitement du bois (Mélange Cuivre, Chrome, Arsenic)  
F. PERSIN, T. TOULARASTEL, J. SANDEAUX, R. SANDEAUX, C. GAVACH  
127.PDF
