# Phloeodictines A1-A7 and C1-C2, Antibiotic and Cytotoxic Guanidine Alkaloids from the New Caledonian Sponge, Phloeodictyon sp. 

Elly Kourany-Lefoll, Olivier Laprévote, Thierry Sévenet, Alain Montagnac, Mary Païs*<br>Institut de Chimie des Substances Naturelles, CNRS, 91198 Gif-Sur-Yvette Cédex, France,<br>and Cécile Debitus<br>Centre Orstom, BP A5, Noumea, New Caledonia.

#### Abstract

Phloeodictines A1-A7 (3a, 3b, 4a, 4b, 4c, 5a, 5b) and phloeodictines Cl-C2 (6a, 6b), new antibacterial and cytotoxic guanidine alkaloids, have been isolated from the sponge Phloeodictyon sp. Their structures were established essentially by mass spectrometry utilizing B/E linked scanning and by 2D NMR experiments.

We have recently reported the structure elucidation of two antibacterial and cytotoxic guanidine derivatives containing an unprecedented 6-hydroxy-1,2,3,4-tetrahydropyrrolo[1,2-a] pyrimidinum skeleton, phloeodictines A (1) and B (2), isolated from the New-Caledonian deep water sponge Phlooodictyon sp. ${ }^{1}$ (family Nepheliospongia, order Nepheliospongidae). Further search for bioactive agents from the same sponge resulted in the isolation of new structurally related pyrrolo[1,2-a]pyrimidines named phloeodictines A1-A7 (3a, 3b, $\mathbf{4 a}, \mathbf{4 b}, \mathbf{4 c}, \mathbf{5 a}, \mathbf{5 b})$ and C1-C2 ( $\mathbf{6 a}, \mathbf{6 b}$ ). The structures of these compounds were established essentially by comparison of their collisionally activated dissociation (CAD) mass spectra obtained using FAB ionisation and $B / E$ linked scanning ${ }^{2}$ with those of 1 . All compounds exhibited in vitro antibacterial activities and were moderately cytotoxic against KB cells.

The lyophilized sponge was extracted with methanol. The antimicrobial methanolic extract was desalted over Amberlite XAD-7 and subsequently subjected to medium pressure reversed-phase liquid chromatography ( $\mathrm{H}_{2} \mathrm{O}-\mathrm{MeOH}$ step gradient). Final purification using preparative and semi-preparative RP-HPLC [Delta-Pak $\mathrm{C} 18, \mathrm{MeOH}-\mathrm{NaCl}(0.2 \mathrm{M})-\mathrm{THF}, \mathrm{pH}$ adjusted to 2.2 with HCl yielded a ca $2.6: 1$ mixture (3) of phloeodictines A1 (3a) and A2 (3b), a ca 2.6:0.7:0.3 mixture 4 of phloeodictines A3 (4a), A4 (4b) and A5 (4c), a ca 1:1.4 mixture (5) of phloeodictines A6 (5a) and A7 (5b) and a ca $1: 1$ mixture 6 of phloeodictines Cl ( 6 a ) and C 2 ( $\mathbf{6 b}$ ) as colorless amorphous solids. Typical yields were $0.55 \%$ for $\mathbf{3 , 0 . 0 2 \%}$ for $\mathbf{4}, 0.02 \%$ for $\mathbf{5}$ and $0.54 \%$ for 6 (dry weight sponge).

The UV absorption of mixture 3 was the same as that of the previously reported phloeodictine A (1), exhibiting maxima at $224(\varepsilon 6700)$ and $274(\varepsilon 2200)$ nm. The positive ion FAB mass spectrum of 3 revealed two $\mathrm{M}^{+}$peaks at $m / z 432$ and 418 corresponding to phloeodictine A 1 (3a) and A 2 (3b) respectively. The molecular formulas $\mathrm{C}_{25} \mathrm{H}_{46} \mathrm{~N}_{5} \mathrm{O}\left(\mathrm{M}^{+}, \mathrm{m} / \mathrm{z} 432.3712, \Delta-1.0 \mathrm{mmu}\right)$ for $\mathbf{3 a}$ and $\mathrm{C}_{24} \mathrm{H}_{44} \mathrm{~N}_{5} \mathrm{O}\left(\mathrm{M}^{+}, \mathrm{m} / \mathrm{z}\right.$

Fig. 2. EIMS fragmentation of $\mathbf{8 a}$ and $\mathbf{8 b}$.
418.3545, $\Delta 0.1(\Delta 0.1 \mathrm{mmu})$ for 3b, established by HRFABMS, differed only by 14 and 28 amu respectively from $1\left(\mathrm{C}_{26} \mathrm{H}_{48} \mathrm{~N}_{5} \mathrm{O}\right)$, suggesting that the mass difference could correspond to fewer methylene units in the side chains. Since $\mathbf{3 a}$ and $\mathbf{3 b}$ appeared to be homologues of $\mathbf{1}$, it was desirable to see if CAD spectra could be used to pinpoint the location of the homology. To this end, the product ion mass spectra of the $\mathrm{M}^{+}$ions of $\mathbf{1 , 3 a}$ and $\mathbf{3 b}$ were acquired. The two major cleavage processes obtained are shown in figure 1. For 1, the mass of the ion arising from path $a$ is at $m / z 114$, while the ion from path $b$ appears at $m / z 3333$. Collisional activation of the $\mathrm{M}^{+}$ion of $\mathbf{3 a}$ indicates that the N -butylguanidine side chain in $\mathbf{1}$ is replaced, in $\mathbf{3 a}$, by a N -pentylguanidine moiety (ion from path $a$ at $m / z 128$ ). In the case of $\mathbf{3 b}$, the ion arising from path $b$ cleavage is at $m / z 305$, while the ion from path $a$ is unshifted as compared to 1 , at $m / z 114$, revealing that the difference between $\mathbf{1}$ and $\mathbf{3 b}$ resides in the allyl side chain.

The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectral data of 3 (Table 1) further supported the structural assignment of the alkaloids. Two different sets of ${ }^{13} \mathrm{C}$ signals were observed, in a ratio of 2.6 to 1 , for the guanidine side chain methylene groups of 3 a and $\mathbf{3 b}$ respectively. All other ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ resonances were virtually unchanged from the corresponding signals of $\mathbf{1}$. The assignment of all protonated carbons were confirmed by DQF-COSY ${ }^{4}$ and HMQC experiments.

Catalytic hydrogenation of $\mathbf{3}$ led to mixture 7 of the tetrahydroalkaloids 7 a and 7 b , which were further converted using acetylacetone in $\mathrm{HCO}_{3} \mathrm{Na} / \mathrm{H}_{2} \mathrm{O} / \mathrm{EtOH}$ (3h, reflux) to mixture 8 of their 4,6 -dimethylpyrimidine derivatives $\mathbf{8 a}$ and $\mathbf{8 b}$, respectively. The HREIMS spectrum of $\mathbf{8}$ confirmed that $\mathbf{8 a}$ and $\mathbf{8 b}$ differed by the chain lenght at N -1. In addition to the molecular ions $\left(\mathrm{M}^{+}\right)$at $\mathrm{m} / \mathrm{z} 500.4305\left(\mathrm{C}_{30} \mathrm{H}_{54} \mathrm{~N}_{5} \mathrm{O}, \Delta 2.4 \mathrm{mmu}\right)$ and $486.4144\left(\mathrm{C}_{29} \mathrm{H}_{52} \mathrm{~N}_{5} \mathrm{O}, \Delta 2.8 \mathrm{mmu}\right.$ ), the spectrum displayed typical fragmentations (Fig. 2) at $\mathrm{m} / \mathrm{z} 375.3330$ $\left(\mathrm{C}_{24} \mathrm{H}_{43} \mathrm{~N}_{2} \mathrm{O}, \Delta 4.0 \mathrm{mmu}\right), 361.3191\left(\mathrm{C}_{23} \mathrm{H}_{41} \mathrm{~N}_{2} \mathrm{O}, \Delta 2.7 \mathrm{mmu}\right), 330.2283\left(\mathrm{C}_{18} \mathrm{H}_{28} \mathrm{~N}_{5} \mathrm{O}, \Delta 1.0 \mathrm{mmu}\right)$, $316.2100\left(\mathrm{C}_{17} \mathrm{H}_{26} \mathrm{~N}_{5} \mathrm{O}, \Delta 3.7 \mathrm{mmu}\right), 192,178,150$ and 136.

The UV spectrum of mixture 4 was the same as that of $\mathbf{1}$ and 3 , indicative of the same absorbing chromophore. The HRFABMS of 4 exhibited two $\mathrm{M}^{+}$ions at $m / z .404 .3415(\Delta-2.6 \mathrm{mmu})$ and 390.3265 ( $\Delta$ 3.2 mmu ) corresponding to the molecular formulas $\mathrm{C}_{23} \mathrm{H}_{42} \mathrm{~N}_{5} \mathrm{O}$ and $\mathrm{C}_{22} \mathrm{H}_{40} \mathrm{~N}_{5} \mathrm{O}$, respectively. However, CAD spectra led to the identification of two isomers, phloeodictines A4 (4b) and A5 (4c) occurring at m/z 390 and differing in the lengths of their guanidine and allyl side chains. This identification is based on the observed product ions at $\mathrm{m} / \mathrm{z} 263$ and 277 arising from the collisional activation of the $\mathrm{M}^{+}$ion at $\mathrm{m} / \mathrm{z} 390$ (Fig. 1). The CAD spectrum of the ion at $m / z 404$ displayed the major fragmentations shown in figure 1 (product ions at $\mathrm{m} / \mathrm{z}$ 277 and 128), allowing to assign the structure of phloeodictine $\mathrm{A} 4(4 a)$. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of 4 were almost identical to those of $\mathbf{3}$, in agreement with the proposed structures $4 \mathrm{a}, \mathbf{4 b}$ and $\mathbf{4 c}$.

The UV spectrum of mixture 5 was the same as those of 1,3 and 4 . The FAB mass spectrum of 5 showed two $\mathrm{M}^{+}$peaks at $m / z 448$ and 434. The molecular formulas $\mathrm{C}_{26} \mathrm{H}_{50} \mathrm{~N}_{5} \mathrm{O}\left(\mathrm{M}^{+}, m / z 448.4003, \Delta 1.2\right.$ $\mathrm{mmu})$ for phloeodictine $\mathrm{A} 6(5 \mathrm{a})$ and $\mathrm{C}_{25} \mathrm{H}_{48} \mathrm{~N}_{5} \mathrm{O}\left(\mathrm{M}^{+}, \mathrm{m} / \mathrm{z} 434.3848, \Delta 1.1 \mathrm{mmu}\right)$ for phloeodictine A 7 (5b) were deduced from HRFABMS. On the basis of the information obtained from the CAD spectra of both molecular ions (Fig. 1), the difference of 14 amu between $\mathbf{5 a}$ and $\mathbf{5 b}$ could be located in the guanidine side chain. Comparison of the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data of 5 with those of 4 revealed that the molecules were almost identical, the only difference being the absence, in 5 , of the signals due to the allyl group $\left[\delta_{\mathrm{C}} 139.9\right.$ (d) and $115.4(\mathrm{t}) ; \delta_{\mathrm{H}} 5.80(\mathrm{ddt}, 1 \mathrm{H}), 5.01(\mathrm{dd}, 1 \mathrm{H})$ and $\left.4.92(\mathrm{dd}, 1 \mathrm{H})\right]$ and their replacement by signals at $\delta_{\mathrm{c}} 23.1(\mathrm{t}$,

2 C ) and 29.1 (d) and $\delta_{\mathrm{H}} 0.88$ (d) due to a terminal isopropyl group. The structures of phloeodictines A5 and A6 were, consequently, concluded to be $\mathbf{5 a}$ and $\mathbf{5 b}$ respectively.

The UV spectrum of 6 exhibited a maximum at $219 \mathrm{~nm}(\varepsilon 9100)$ suggesting the presence of a distinct UV chromophore than the previously described phloeodictines. The FAB mass spectrum of 6 contained two weak $\mathrm{M}^{+}$peaks at $m / z 551$ (12\%) and $537(5 \%)$. The molecular formulas $\mathrm{C}_{28} \mathrm{H}_{55} \mathrm{~N}_{8} \mathrm{OS}\left(\mathrm{M}^{+}, m / z 551.4220, \Delta 0.0\right.$ mmu ) for phloeodictine $\mathrm{Cl}(6 \mathrm{a})$ and $\mathrm{C}_{27} \mathrm{H}_{53} \mathrm{~N}_{8} \mathrm{OS}\left(\mathrm{M}^{+}, \mathrm{m} / \mathrm{z} 537.4083, \Delta-2.0 \mathrm{mmu}\right)$ for phloeodictine $\mathrm{C} 2(6 \mathrm{~b})$ were established by HRFABMS. Elemental analysis ( $\mathrm{S}, \mathrm{Cl}$ ) confirmed the presence of sulfur and indicated that the compounds were isolated as trichloride salts.

Comparison of the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of 6 with those of phloeodictine $\mathrm{B}^{1}(2)$ showed that ring B $\Delta^{7,8}$ double bond [ $\delta_{\mathrm{C}} 170.0$ (s) and $108.8(\mathrm{~d}) ; \delta_{\mathrm{H}} 6.95(\mathrm{~s})$ ] had been replaced by a methylene resonance at $\delta_{\mathrm{C}}$ $38.9(\mathrm{t}, \mathrm{C}-8)$ and $\delta_{\mathrm{H}} 3.80(\mathrm{~m}, \mathrm{H}-8 \mathrm{a})$ and $3.17(\mathrm{~m}, \mathrm{H}-8 \mathrm{~b})$ and by a methine signal at $\delta_{\mathrm{C}} 46.3(\mathrm{C}-7)$ associated with a proton multiplet at $\delta_{\mathrm{H}} 3.65$. An additional difference lay in the presence of two sets of ${ }^{13} \mathrm{C}$ resonances, in a ratio of 1 to 1 , corresponding to the guanidine side chain methylene groups of $\mathbf{6 a}$ and $\mathbf{6 b}$ (Tables 2 and 3, respectively). The remainder of the spectra were essentially identical with those of 2 . Evaluation of the HMQC spectrum of 6 , together with comparison of the COSY ${ }^{5}$ and HOHAHA ${ }^{6}$ correlations with those of 2 , allowed the substitution pattern about the pyrrolo[1,2-a]pyrimidine ring to be confirmed. Finally, analysis of the HMBC spectrum (Tables 2 and 3) led to the assignment of structures $\mathbf{6 a}$ and $\mathbf{6 b}$ for phloeodictines C 1 and $\mathbf{C 2}$, respectively. Particularly relevant were the correlations observed between $\mathrm{H}-7(\delta 3.65)$ and $\mathrm{C}-26$ ( $\delta 31.6$ ) as well as the' complementary cross peak between H-26 ( $\delta 2.79$ ) and C-7 ( $\delta 46.3$ ), thus establishing the connectivity of the sulfur side chain at position 7. However, no NOE correlations were observed and the stereochemistry at C-7 was not determined.

The structure of the sulfur side chain was also supported by diagnostic peaks in the HRFAB mass spectrum of 6 at $\mathrm{m} / \mathrm{z} 432.3712\left(\mathrm{C}_{25} \mathrm{H}_{46} \mathrm{~N}_{5} \mathrm{O}, \Delta-1.0 \mathrm{mmu}\right)$ and $\mathrm{m} / \mathrm{z} 418.3545\left(\mathrm{C}_{24} \mathrm{H}_{44} \mathrm{~N}_{5} \mathrm{O}, \Delta 0.1 \mathrm{mmu}\right)$ formed by the loss of $\left(\mathrm{NH}_{2}\right) \mathrm{NH}=\mathbf{C}-\mathrm{NH}\left(\mathrm{CH}_{2}\right)_{2}-\mathrm{SH}$ from the molecular ions of $\mathbf{6 a}$ and $\mathbf{6 b}$, respectively. The CAD spectra of the $\mathrm{M}^{+}$ions of $\mathbf{6 a}$ and $\mathbf{6 b}$ (Fig. 3) provided confirmation of this fragmentation (produett ions at $\mathrm{m} / \mathrm{z} 432$ and 418). Moreover, collisional activation of the positive ions at $\mathrm{m} / \mathrm{z} 432$ and 418 yielded fragmentation patterns similar to those observed for the molecular ion of phloeodictines A1 (3a) and A2 (3b), respectively, thus confirming that the difference of one methylene unit between 6 a and 6 b resided in the guanidine side chain moiety.

Alkaline treatment of 6 afforded the disulfide 9 . Compound 9 most probably results from the dimerisation of the radical $\mathrm{NH}_{2}(\mathrm{NH}=) \mathrm{C}-\mathrm{NH}-\left(\mathrm{CH}_{2}\right)_{2}-\mathrm{S}^{\cdot}(\mathbf{1 2})$ which could be formed as suggested in scheme $1^{7,8,9}$.

Mixtures 3, 4, 5 and 6 have been tested against several bacteria using the standard microdilution plate assay and were found to possess a wide spectrum of activity with the following respective MIC's ( $\mu \mathrm{g} / \mathrm{ml}$ ): Staphylococcus aureus ( $3,30,1,3$ ), Escherichia coli ( $3,30,3,>30$ ), Pseudomonas aeruginosa $(30,>30,30$, $>30$ ), Clostridium perfringens ( $30,>30,1,>100$ ), Bacteroides fragilis ( $10,>30,3,>100$ ) and Peptococcus assaccharolyticus ( $10,>30,3,>100$ ). These substances also exhibited in vitro cytotoxicity towards KB human nasopharyngeal carcinoma cells with $\mathrm{IC}_{50}$ 's of $2.2,3.5,0.6$ and $1.8 \mu \mathrm{~g} / \mathrm{ml}$ for $\mathbf{3 , 4 , 5}$ and $\mathbf{6}$ respectively.

Schcme 1
internal standard. 2D-NMR experiments were performed with standard pulse sequences. HPLC was carried out on Waters Associated instruments. Elemental analyses were performed at the ICSN, CNRS, Gif-sur-Yvette, France.

Extraction and isolation. Specimens of Phloeodictyon sp. (1.5 Kg fresh weight) were collected, extracted and desalted as described earlier ${ }^{1}$. The desalted active fraction ( 18.5 g ) was chromatographed under RP medium-pressure liquid chromatography by using a C-18 stationary phase ( $55-105 \mu \mathrm{~m}, 25 \mathrm{~cm} \times 30 \mathrm{~mm}$ ) and a step gradient of $\mathrm{H}_{2} \mathrm{O}-\mathrm{CH}_{3} \mathrm{OH}$ as eluent. Purification was achieved by repetitive preparative and semipreparative HPLC using Waters Delta Prep 3000 chromatography system [Delta-Pak C-18, $15 \mu, 100 \AA, 47.0$ $\mathrm{mm} \times 30.0 \mathrm{~cm}$, flow rate $100 \mathrm{ml} / \mathrm{min}$ followed by final purification on Delta-Pak C-18, $15 \mu, 100 \AA, 25.0 \mathrm{~mm} \times$ 10.0 cm , flow rate $8 \mathrm{ml} / \mathrm{min}$, UV double detection at 230 and 280 nm , eluent $\mathrm{MeOH}-\mathrm{NaCl}(0.2 \mathrm{M})$-THF (56:43:1 followed by $66: 33: 1, \mathrm{pH}$ adjusted to 2.2 with HCl ), to afford, in order of increasing polarity, mixtures $4(9 \mathrm{mg}), 6(244 \mathrm{mg}), 3(250 \mathrm{mg})$ and $5(11 \mathrm{mg})$ as amorphous solids.

Mixture 3 of phloeodictines A1 (3a) and A2 (3b). UV (MeOH) $\lambda_{\max } 224$ ( $\varepsilon$ 6700) and 274 (2200) nm; FTIR (film) $v_{\max } 3400-3100,3019,2928,2855,1665,1589,1462 \mathrm{~cm}^{-1}$; FABMS m/z $432\left(\mathrm{M}^{+}\right.$, '100), $418\left(\mathrm{M}^{+}, 38\right), 305(27), 128(48), 114(73)$; HRFABMS $m / z 432.3712\left(\mathrm{C}_{25} \mathrm{H}_{46} \mathrm{ON}_{5}\right.$ requires 432.3702), $418.3545\left(\mathrm{C}_{24} \mathrm{H}_{44} \mathrm{ON}_{5}\right.$ requires 418.3545$)$; CAD spectrum of $m / z 432 \mathrm{~m} / \mathrm{z} 415,414,390,305$, 128 ; CAD spectrum of $m / z 418 \mathrm{~m} / \mathrm{z} 401,400,357,305,114$; CAD spectrum of $\mathrm{m} / \mathrm{z} 128 \mathrm{~m} / \mathrm{z} 111,86$; CAD spectrum of $\mathrm{m} / \mathrm{z} 114 \mathrm{~m} / \mathrm{z} 97,72 .{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR : Table 1.

Mixture 4 of phloeodictines A3 (4a), A4 (4b) and A5 (4c). UV (MeOH) $\lambda_{\max } 224$ ( $\varepsilon$ 6700) and 274 (2200) nm; FTIR (film) $v_{\max } 3400-3100,2928,2850,1665,1589,1462 \mathrm{~cm}^{-1} ;$ FABMS $m / \mathrm{z} 404$ $\left(\mathrm{M}^{+}, 100\right), 390\left(\mathrm{M}^{+}, 38\right), 128(48), 114(73)$; HRFABMS m/z $404.3415\left(\mathrm{C}_{23} \mathrm{H}_{42} \mathrm{~N}_{5} \mathrm{O}\right.$ requires 404.3389), $390.3265\left(\mathrm{C}_{22} \mathrm{H}_{40} \mathrm{~N}_{5} \mathrm{O}\right.$ requires 390.3233); CAD spectrum of $\mathrm{m} / \mathrm{z} 404 \mathrm{~m} / \mathrm{z} 387,386,362,345,277,128$; CAD spectrum of $m / z 390 \mathrm{~m} / \mathrm{z} 372,277,263,128,114$; CAD spectrum of $\mathrm{m} / \mathrm{z} 128 \mathrm{~m} / \mathrm{z} 111$, 86; CAD spectrum of $\mathrm{m} / \mathrm{z} 114 \mathrm{~m} / \mathrm{z} 97,72 ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CD}_{3} \mathrm{OD}\right)$ for $4 \mathrm{a}: \delta 5,80\left(\mathrm{CH}_{2}-\mathrm{CH}=\mathrm{CH}_{2}\right.$, ddt, $\mathrm{J}=10$, 17 and 7 $\mathrm{Hz}), 5,01\left(\mathrm{CH}_{2}-\mathrm{CH}=\mathrm{CH}_{\mathrm{a}} \mathrm{H}_{\mathrm{b}}, \mathrm{dd}, \mathrm{J}=2,17 \mathrm{~Hz}\right), 4,92\left(\mathrm{CH}_{2}-\mathrm{CH}=\mathrm{CH}_{a} \mathrm{H}_{\mathrm{b}}, \mathrm{dd}, \mathrm{J}=2,10 \mathrm{~Hz}\right), 3.62\left(\mathrm{H}-9{ }^{\prime}\right.$ and $\mathrm{H}-$ $2, \mathrm{~m}), 3.55(\mathrm{H}-4 \mathrm{a}, \mathrm{m}) 3.20(\mathrm{H}-4 \mathrm{~b}$ and $\mathrm{H}-13 \mathrm{l}, \mathrm{m}), 2.20(\mathrm{H}-3 \mathrm{a}, \mathrm{m}), 2.05\left(\mathrm{H}-3 \mathrm{~b}, \mathrm{H}-14 \mathrm{a}\right.$ and $\mathrm{CH}_{2}-\mathrm{CH}=\mathrm{CH}_{2}$, $\mathrm{m}), 1.74\left(\mathrm{H}-10^{\prime}\right.$ and $\left.\mathrm{H}-14 \mathrm{~b}, \mathrm{~m}\right), 1.62\left(\mathrm{H}-12\right.$ ' m ), $1.45\left(\mathrm{H}-1 \mathrm{l}^{\prime}, \mathrm{m}\right), 1.32(\mathrm{H}-16$ to $\mathrm{H}-20$, br s); 1.14 (H-15, $\mathrm{m}) ;{ }^{1} \mathrm{H}$ NMR ( $\mathrm{CD}_{3} \mathrm{OD}$ ) for $\mathbf{4 b}$ : same as for 4 a except $\delta 3.62$ ( $\mathrm{H}-9$ and $\mathrm{H}-2, \mathrm{~m}$ ), $3.20(\mathrm{H}-4 \mathrm{~b}$ and $\mathrm{H}-12$, m$)$, $1.74(\mathrm{H}-10$ and $\mathrm{H}-14 \mathrm{~b}, \mathrm{~m}), 1.62(\mathrm{H}-12, \mathrm{~m}) ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CD}_{3} \mathrm{OD}\right)$ for $\mathbf{4 c}$ : same as for 4 a except $\delta 1.32$ ( $\mathrm{H}-16$ to $\mathrm{H}-19$, br s); ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{D}_{2} \mathrm{O}\right)$ for $4 \mathrm{a}: \delta 160.2(\mathrm{C}-8 \mathrm{a}), 157.9(\mathrm{C}-14), 153.2(\mathrm{C}-7), 141.6\left(\mathrm{CH}_{2}-\mathrm{CH}=\mathrm{CH}_{2}\right)$, $\left.120.7(\mathrm{C}-8), 115.2\left(\mathrm{CH}_{2}-\mathrm{CH}=\mathrm{CH}_{2}\right), 98.8(\mathrm{C}-6), 53.3(\mathrm{C}-9)^{\prime}\right), 46.5(\mathrm{C}-2), 42.0(\mathrm{C}-13), 36.9(\mathrm{C}-4), 34.8(\mathrm{C}-$ 14), $34.3\left(\mathrm{CH}_{2}-\mathrm{CH}=\mathrm{CH}_{2}\right), 29.4(\mathrm{C}-16$ to $\mathrm{C}-20), 28.8\left(\mathrm{C}-10^{\prime}\right), 28.0\left(\mathrm{C}-12\right.$ ) , $24.0(\mathrm{C}-15), 23.7\left(\mathrm{C}-11^{\prime}\right), 20.0$ (C-3); ${ }^{13} \mathrm{C}$ NMR ( $\mathrm{D}_{2} \mathrm{O}$ ) for $4 \mathrm{~b}:$ same as for 4 a except $\delta 157.9$ (C-13), $53.2(\mathrm{C}-9), 42.0(\mathrm{Cl} 2), 26.2(\mathrm{C}-10)$, $26.2(\mathrm{C}-11) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{D}_{2} \mathrm{O}\right)$ for 4 c : same as for 4 a except $\delta 29.4$ ( $\mathrm{C}-16$ to $\mathrm{C}-20$ ).

Mixture 5 of phloeodictines A6 (5a) and A7 (5b). ## EXPERIMENTAL

General. UV spectra were recorded on a Shimadzu UV-160 spectrophotometer; IR on a Nicolet 205 FT-IR spectrometer; EIMS ( 70 eV ) on a Kratos MS 50; HREIMS, FABMS (bombardment gas : xenon; matrix : glycerol +HCl ) and $\mathrm{B} / E$ linked scan spectra on a Kratos MS 80 . Collisional activation was obtained using argon as collision gas; the collision gas pressure was set to give a $30 \%$ attenuation of the parent ion beam measured at the final collector. HRFABMS were acquired on a VG-ZAB-SEQ spectrometer; NMR on Bruker AM $250\left({ }^{1} \mathrm{H}\right.$ and ${ }^{13} \mathrm{C}$ NMR spectra) and AM 400 ( ${ }^{1} \mathrm{H}$ and 2D-NMR spectra). All NMR spectra were recorded with TMS as
$6.5 \mathrm{~Hz}), 3.70\left(\mathrm{H}-9{ }^{\prime}\right.$ and $\left.\mathrm{H}-2, \mathrm{~m}\right), 3.55(\mathrm{H}-4 \mathrm{a}, \mathrm{m}), 3.25(\mathrm{H}-4 \mathrm{~b}$ and $\mathrm{H}-13 \mathrm{l}, \mathrm{m}), 2.22(\mathrm{H}-3 \mathrm{a}, \mathrm{m}), 2.00(\mathrm{H}-3 \mathrm{~b}$ and $\mathrm{H}-14 \mathrm{a}, \mathrm{m}$ ), 1.79 ( $\mathrm{H}-10^{\prime}$ and $\mathrm{H}-14 \mathrm{~b}, \mathrm{~m}$ ), 1.65 ( $\mathrm{H}-12{ }^{\prime}, \mathrm{m}$ ), 1.45 ( $\mathrm{H}-11^{\prime}$ ), 1.30 ( $\mathrm{H}-16$ to $\mathrm{H}-23$, br s), 1.14 ( $\mathrm{H}-15, \mathrm{~m}$ ), 0.90 ( $\mathrm{CHMe} 2, \mathrm{~d}$ ); ${ }^{1} \mathrm{H}$ NMR spectrum for $5 \mathbf{b b}$ : same as for 5 a except $\delta 3.70$ ( $\mathrm{H}-9$ and $\mathrm{H}-2, \mathrm{~m}$ ), 3.25 ( $\mathrm{H}-12$ and $\mathrm{H}-4 \mathrm{~b}, \mathrm{~m}$ ), 1.79 ( $\mathrm{H}-10$ and $\mathrm{H}-14 \mathrm{~b}, \mathrm{~m}$ ), $1.65(\mathrm{H}-11, \mathrm{~m}) ;{ }^{13} \mathrm{C}$ NMR ( $\mathrm{D}_{2} \mathrm{O}$ ) for $5 \mathrm{a}: \delta 160.2$ (C8a), 158.1 (C-14'), 153.2 (C-7), 121.1 (C-8), 98.8 (C-6), 53.6 (C-9'), 46.6 (C-2), 42.2 (C-13'), 40.1 (C23), 37.4 (C-4), 35.4 (C-14), 31.1-30.5 (C-16 to C-22), 29.1 ( $\mathrm{CHMe}_{2}$ ), 28.5 (C-10'), 28.2 (C-12'), 24.8 (C15), 24.1 ( $\mathrm{C}-11^{\prime}$ ), $23.1\left(\mathrm{CHMe}_{2}\right), 20.0(\mathrm{C}-3) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{D}_{2} \mathrm{O}\right)$ for $\mathbf{5 b}$ : same as for 5 a except $\delta 158.1$ (C13), 53.3 (C-9), 46.6 (C-2), 42.3 (C-12), 26.2 (C-10), 26.1 (C-11).

Mixture 6 of phloeodictines C1 ( $6 a$ ) and C2 ( 6 b). UV (MeOH) $\lambda_{\max } 219 \mathrm{~nm}(\varepsilon 9400)$; FTIR (film) $v_{\max } 3400-3100,3019,2855,1668,1462 \mathrm{~cm}^{-1}$; FABMS $m / z 551\left(\mathrm{M}^{+}, 5\right), 537\left(\mathrm{M}^{+}, 10\right), 432(48)$, 418 (37) 305 (14), 128 (27), 114 (54); HRFABMS $m / z 551.4220\left(\mathrm{C}_{28} \mathrm{H}_{55} \mathrm{~N}_{8} \mathrm{OS}\right.$ requires 551.4220), $537.4083\left(\mathrm{C}_{27} \mathrm{H}_{53} \mathrm{~N}_{8} \mathrm{OS}\right.$ requires 537.4063), $432.3712\left(\mathrm{C}_{25} \mathrm{H}_{46} \mathrm{~N}_{5} \mathrm{O}\right.$ requires 432.3702), 418.3545 $\left(\mathrm{C}_{24} \mathrm{H}_{44} \mathrm{~N}_{5} \mathrm{O}\right.$ requires 418.3546 ); Anal. Calcd for $\mathrm{C}_{27.5} \mathrm{H}_{54} \mathrm{~N}_{8} \mathrm{OS}, 3 \mathrm{HCl}: \mathrm{S}, 5.0 ; \mathrm{Cl}, 16.5$. Found: $\mathrm{S}, 4.9 ; \mathrm{Cl}$, 16.3; CAD spectrum of $m / z 551 \mathrm{~m} / \mathrm{z} 432$; CAD spectrum of $m / z 537 \mathrm{~m} / \mathrm{z} 418$; CAD spectrum of $m / z 432 \mathrm{~m} / \mathrm{z}$ $415,414,401,390,371,305,238,128$; CAD spectrum of $m / z 418 \mathrm{~m} / \mathrm{z} 401,400,357,305,224,114$; CAD spectrum of $m / z 128 \mathrm{~m} / \mathrm{z} 111,86$; CAD spectrum of $m / z 114 \mathrm{~m} / \mathrm{z} 97,72 ;{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR : Tables 2-3.

Mixture 7 of hydrogenation derivatives $7 a$ and $7 b$. A methanolic solution ( 15 ml ) of $\mathbf{3}[70 \mathrm{mg}$, $10 \% \mathrm{Pd} / \mathrm{C}$ (ca 40 mg ) was shaken for 3 h under an atmosphere of hydrogen. After removal of the catalyst and the solvent, a mixture of the hydrogenated derivatives $7 \mathbf{a}$ and $\mathbf{7 b}$ was obtained ( $60 \mathrm{mg}, 86 \%$ theoretical yield) as a colorless amourphous solid. UV (MeOH) $\lambda_{\max } 219 \mathrm{~nm}(\varepsilon 9800)$; FTIR (film) $v_{\max } 3400-3100,3019$, 2930, 2855, 1668, $1467^{\circ} \mathrm{cm}{ }^{-1}$; FABMS $m / z 436\left(\mathrm{M}^{+}, 65\right), 422\left(\mathrm{M}^{+}, 30\right) ;{ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CD}_{3} \mathrm{OD}\right): \delta 3.40(\mathrm{~m}$, $5 \mathrm{H}), 3.30(\mathrm{~m}, 3 \mathrm{H}), 3.12(\mathrm{~m}, 1 \mathrm{H}), 3.00(\mathrm{~m}, 1 \mathrm{H}), 2.19(\mathrm{~m}, 2 \mathrm{H}), 2.00(\mathrm{~m}, 2 \mathrm{H}), 1.84-1.71(\mathrm{~m}, 3 \mathrm{H}), 1.60(\mathrm{~m}$, $2 \mathrm{H}), 1.45(\mathrm{~m}, 2 \mathrm{H}), 1.32(\mathrm{~m}, 2 \mathrm{H}), 1.29-1.20(\mathrm{~m}, 16 \mathrm{H}), 0.89(\mathrm{t}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{D}_{2} \mathrm{O}\right): \delta 164.7(\mathrm{~s}), 158.0$ (s), $98.5(\mathrm{~s}), 53.6(\mathrm{t}), 46.0(\mathrm{t}), 38.3(\mathrm{t}), 38.0(\mathrm{t}), 33.1(\mathrm{t}), 32.4(\mathrm{t}), 30.9-30.5(\mathrm{t}, 9 \mathrm{C}), 28.9(\mathrm{t}), 28.7(\mathrm{t}), 27.5$ (t), $26.3(\mathrm{t}), 25.2(\mathrm{t}), 24.7(\mathrm{t}), 24.3(\mathrm{t}), 24.3(\mathrm{t}), 23.8(\mathrm{t}), 20.1(\mathrm{t}), 15.0(\mathrm{q}) ;$ FABMS $\mathrm{m} / \mathrm{z} 436\left(\mathrm{M}^{+}, 65\right)$ and $422\left(\mathrm{M}^{+}, 30\right)$.

Mixture 8 of 4,6-dimethylpyrimidine derivatives $8 a$ and $8 b$. Mixture $7(60 \mathrm{mg})$ was dissolved in $95 \% \mathrm{EtOH}(1 \mathrm{ml})$ and $\mathrm{H}_{2} \mathrm{O}(0.5 \mathrm{ml})$ containing $\mathrm{NaHCO}_{3}(0.04 \mathrm{~g})$. Acetylacetone $(70 \mu \mathrm{l})$ was added and the mixture was refluxed for 3 h . The solution was then neutralized with HCl , filtered and evaporated till dryness. After removal of NaCl by precipitation in $\mathrm{CHCl}_{3}-\mathrm{EtOH}(85: 15)$, filtration and evaporation, the residue was purified by chromatography on silica gel eluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}$ (8:0.2 to 7:3) affording compounds $8 \mathbf{a}$ and 8 b as an inseparable mixture ( $17 \mathrm{mg}, 43 \%$ theoretical yield). UV (MeOH) $\lambda_{\max } 235$ ( $\varepsilon 6000$ ) and 299 (1080) nm ; FTIR (film) $v_{\max } 3440-3100,3019,2920,2855,1658,1588 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 7.12$ (exchangeable br s, NH), $6.30(\mathrm{~s}, 1 \mathrm{H}), 2.50(\mathrm{br} \mathrm{s}, 6 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $\left.\mathrm{D}_{2} \mathrm{O}\right): \delta 167.0(\mathrm{~s}, 2 \mathrm{C}), 163.7(\mathrm{~s}), 161.9$ (s), 109.3 (d), 98.1 ( s$), 52.4(\mathrm{t}), 44.8(\mathrm{t}), 40.4(\mathrm{t}), 37.6(\mathrm{t}), 36.4(\mathrm{t}), 31.5(\mathrm{t}), 31.0(\mathrm{t}), 28.8-29.3(\mathrm{t}, 9 \mathrm{C})$, 28.8 (t), 26.6 (t), 23.5 (q, 2C), 23.4 (t), 22.3 (t), 18.6 ( $), 13.7$ (q); HREIMS $m / z 500.4305\left(\mathrm{M}^{+}, \mathrm{C}_{30} \mathrm{H}_{54} \mathrm{~N}_{5} \mathrm{O}\right.$ requires 500.4329), $486.4144\left(\mathrm{M}^{+}, \mathrm{C}_{29} \mathrm{H}_{52} \mathrm{~N}_{5} \mathrm{O}\right.$ requires 486.4172$), 375.3330\left(\mathrm{C}_{24} \mathrm{H}_{43} \mathrm{~N}_{2} \mathrm{O}\right.$ requires 375.3375), $361.3191\left(\mathrm{C}_{23} \mathrm{H}_{41} \mathrm{~N}_{2} \mathrm{O}\right.$ requires 361.3218$)$, $330.2283\left(\mathrm{C}_{18} \mathrm{H}_{28} \mathrm{~N}_{5} \mathrm{O}\right.$ requires 330.2293), 316.2100 $\left(\mathrm{C}_{17} \mathrm{H}_{26} \mathrm{~N}_{5} \mathrm{O}\right.$ requires 316.2137$)$, $192.1820\left(\mathrm{C}_{11} \mathrm{H}_{18} \mathrm{~N}_{3}\right.$ requires 192.1835), $178.1558\left(\mathrm{C}_{10} \mathrm{H}_{16} \mathrm{~N}_{3}\right.$ requires 178.1567), $150.1020\left(\mathrm{C}_{8} \mathrm{H}_{12} \mathrm{~N}_{3}\right.$ requires 150.1031$), 136.0872\left(\mathrm{C}_{7} \mathrm{H}_{10} \mathrm{~N}_{3}\right.$ requires 136.0875).

$a_{\text {in }} \mathrm{CD}_{3} \mathrm{OD}$ except as noted; $b^{\text {in }}$ DMSO- $d_{6}$.

2,2'-diguanidinodiethyldisulfide (9) To a solution of $6(100 \mathrm{mg})$ in $\mathrm{MeOH}(8 \mathrm{ml})$ was added $\mathrm{NaOH} 8 \mathrm{~N}(1.3 \mathrm{ml})$ and che mixture was stirred for 16 h at room temperature. The solution was then neutralized with HCl , and after removal of NaCl , the residue was purified by CC on reversed phase silica gel (Waters Preparative $\mathrm{C} 1855-105 \mu \mathrm{~m}, 2.4 \mathrm{~g})$. Compound $9(15 \mathrm{mg}, 15 \%$ theoretical yield) was eluted at first with water: FABMS $m / z 273\left[\left(\mathrm{MH}+\mathrm{H}^{35} \mathrm{Cl}\right)^{+},(28)\right], 237\left[(\mathrm{MH})^{+},(58)\right], 120(85), 93(100) ;{ }^{1} \mathrm{H}$ NMR (DMSO- $\left.d_{6}\right): \delta 8.0$ (exchangeable br s, NH), 7.80-7.35 (exchangeable br s, $\mathrm{NH}_{2}$ ), $3.44\left(\mathrm{t}, J=6.5 \mathrm{~Hz}, \mathrm{CH}_{2}-\mathrm{N}\right), 2.90(\mathrm{t}, J=6.5$ $\left.\mathrm{Hz}, \mathrm{CH}_{2}-\mathrm{S}\right) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{D}_{2} \mathrm{O}\right): \delta 158.0\left[\mathrm{~s},-\mathrm{NH}-\mathrm{C}=\mathrm{NH}\left(\mathrm{NH}_{2}\right)\right], 41.0\left(\mathrm{t},-\mathrm{CH}_{2}-\mathrm{NH}-\right), 37.3\left(\mathrm{t},-\mathrm{CH}_{2}-\mathrm{S}-\right)$.

Acknowledgments. We are grateful to the Embassy of France (Ottawa, Canada) and the Ministry of Foreign Affairs (France) for a doctoral fellowship to one of us (E. K.-L.). We also thank the Service Central d'Analyse (CNRS, Lyon, France) for high resolution mass measurements. Acknowledgments are also due to Dr E. Guittet and Mrs C. Fontaine (ICSN, CNRS, Gif-Sur-Yvette) for 2D NMR experiments, to Drs M. Gourdon and N. Berthaud (Rhône-Poulenc Rorer) for antibacterial assays and to Mrs C. Tempête (ICSN, CNRS, Gif-Sur-Yvette) for cytotoxicity tests.

2. Jeenings, K.R.; Mason, R.S., Tandem Mass Spectrometry Utilizing Linked Scanning of Double Focusing Instruments, In Tandem Mass Spectrometry, Mc Lafferty, F.W. Ed., John Wiley and Sons Inc., New York, 1974.
3. The structures of the ions at $m / z 114$ and $m / z 333$ in the FAB mass spectrum of $\mathbf{1}$ were confirmed by highresolution mass measurements (see reference 1).
4. The DQF-COSY spectrum of $3\left(\mathrm{CD}_{3} \mathrm{OD}\right.$ ) showed the following correlations $(\mathrm{H}-\mathrm{H}): 2 \mathrm{ab} / 3 \mathrm{ab}, 3 \mathrm{ab} / 4 \mathrm{ab}, 7 / 8$, $9 \mathrm{ab} / 10,10 / 11,11 / 12,9^{\prime} / 10^{\prime}, 10^{\prime} / 11^{\prime}, 11^{\prime} / 12^{\prime}, 12^{\prime} / 13^{\prime}, 14 \mathrm{a} / 15,15 /(16$ to 22 ), ( 16 to 22 )/23, 23/24, 24/25.
5. The DQF-COSY spectrum of $6\left(\mathrm{CD}_{3} \mathrm{OD}\right)$ showed the following connectivities $(\mathrm{H}-\mathrm{H}): 2 / 3 \mathrm{ab}, 3 \mathrm{ab} / 4 \mathrm{ab}, 7 / 8 \mathrm{ab}$; $25 / 26,14 \mathrm{ab} / 15,15 /(16$ to 22 ), ( 16 to 22 )/23, 23/24, 24/25ab, $26 / 27$ as well as $9 / 10,10 / 11,11 / 12$ for the N butylguanidine moiety of $\mathbf{6 b}$ and $9 / 10^{\prime}, 10^{\prime} / 11^{\prime}, 11^{\prime} / 12^{\prime}, 12^{\prime} / 13^{\prime}$ for the pentylguanidine side chain of $\mathbf{6 a}$.
6. The HOHAHA spectrum of 6 (DMSO- $d_{6}$ ) afforded the following connectivities ( $\mathrm{H}-\mathrm{H}$ ): $2 / 3 \mathrm{ab}, 2 / 4 \mathrm{ab}$, $3 \mathrm{ab} / 4 \mathrm{ab}, 7 / 8 \mathrm{ab}, 25 / 26,14 \mathrm{ab} / 15,15 /(16$ to 22 ), ( 16 to 22 )/23, $23 / 24,23 / 25 \mathrm{ab}, 24 / 25 \mathrm{ab}, 26 / 27,26 / \mathrm{NH}$, $27 / \mathrm{NH}$ as well as $9 / 10^{\prime}, 9^{\prime} / 11^{\prime}, 10^{\prime} / 11^{\prime}, 10^{\prime} / 12^{\prime}, 11^{\prime} / 12^{\prime}, 12^{\prime} / 13^{\prime}, 11^{\prime} / 13^{\prime}, 12^{\prime} / \mathrm{NH}$ and $13 / \mathrm{NH}$ for the pentylguanidine side chain of 6 and $9 / 10,9 / 11,10 / 11,10 / 12,11 / 12,12 / \mathrm{NH}, 11 / \mathrm{NH}$ for the N butylguanidine moiety of $\boldsymbol{6}$.
7. It is known that an enamine can easily transfer one electron to oxygen (see references 8 and 9 ). One can assume that $\mathbf{1 0}$, which is the enamine form of an amidinium (and thus a stronger electron-donating group), easily gives rise to 11 in the presence of atmospheric oxygen.
